## Publish statement

Thank you for purchasing this series UPS.

This series UPS is an intelligent, three-phase in three-phase out, high frequency online UPS designed by our R&D team who is with years of designing experiences on UPS. With excellent electrical performance, perfect intelligent monitoring and network functions, smart appearance, complying with EMC and safety standards, The UPS meets the world's advanced level.

Read this manual carefully before installation

This manual provides technical support to the operator of the equipment.

# 1. Safety

## Important safety instructions - Save these instructions

There exists dangerous voltage and high temperature inside the UPS. During the installation, operation and maintenance, please abide the local safety instructions and relative laws, otherwise it will result in personnel injury or equipment damage. Safety instructions in this manual act as a supplementary for the local safety instructions. Our company will not assume the liability that caused by disobeying safety instructions.

### 1.1 Safety notes

1. Even no connection with utility power, 220/230/240VAC voltage may still exist at UPS terminal!
2. For the sake of human being safety, please well earth the UPS before starting it.
3. Don't open or damage battery, for the liquid spilled from the battery is strongly poisonous and do harmful to body!
4. Please avoid short circuit between anode and cathode of battery, otherwise, it will cause spark or fire!
5. Don't disassemble the UPS cover, or there may be an electric shock!
6. Check if there exists high voltage before touching the battery
7. Working environment and storage way will affect the lifetime and reliability of the UPS. Avoid the UPS from working under following environment for long time
  - ◆ Area where the humidity and temperature is out of the specified range(temperature 0 to 40°C, relative humidity 5%-95%)
  - ◆ Direct sunlight or location nearby heat
  - ◆ Vibration Area with possibility to get the UPS crashed.
  - ◆ Area with erosive gas, flammable gas, excessive dust, etc
8. Keep ventilations in good conditions otherwise the components inside the UPS will be over-heated which may affect the life of the UPS.

### 1.2 Symbols used in this guide

**WARNING! Risk of electric shock**

**CAUTION! Read this information to avoid equipment damage**

## 2. Main Features

### 2.1 Summarization

This series UPS is a kind of three-in-three-out high frequency online UPS.

The UPS can solve most of the power supply problems, such as blackout, over-voltage, under-voltage, voltage sudden drop, oscillating of decreasing extent, high voltage pulse, voltage fluctuation, surge, inrush current, harmonic distortion (THD), noise interference, frequency fluctuation, etc..

This UPS can be applied to different applications from computer device, automatic equipment, communication system to industry equipment.

### 2.2 Functions and Features

#### ◆Integrated solution for data center

UPS can be integrated with battery cabinet, PDU external maintenance bypass, offering excellent choice for data center.

#### ◆3Phase In/3Phase Out UPS

It is 3Phase In/3Phase Out high-density UPS system, of which input current is kept in balance. No unbalance problem might occur.

#### ◆Digital Control

This series UPS is controlled by Digital Signal Processor (DSP); enhance, it increases reliability, performance, self-protection, and self-diagnostics and so on.

#### ◆Battery Configurable

From 30 blocks to 50 blocks, the battery voltage of this series UPS can be configured at 30 blocks, 32 blocks, 34 blocks, 36 blocks, 38 blocks, 40 blocks, 42 blocks, 44 blocks, 46 blocks, 48 blocks or 50 blocks according to your convenience.

#### ◆Charging Current is configurable

Via setting tool, the user may set the capacity of the batteries as well as reasonable charging current as well as maximum charging current. Constant voltage mode, constant current mode or floating mode can be switched automatically and smoothly.

#### ◆Intelligent Charging Method

The series UPS adopts advanced three-stage charging method—

1<sup>st</sup> stage: high current constant current charging

to guarantee to charge back to 90%;

2<sup>nd</sup>-stage: Constant Voltage

In order to vitalize battery and make sure batteries are fully charged

3<sup>rd</sup> stage: floating mode.

With this 3-stage charging method, it extends the life of the batteries and guarantees fast charging.

#### ◆LCD Display

With LCD plus LED displays, the user may easily get UPS status and its operational parameters, such as input/output voltage, frequency & load%, battery % and ambient temperature, etc...

#### ◆Intelligent Monitoring Function

Via optional SNMP Card, you may remotely control and monitor the UPS.

#### ◆EPO Function

The series UPS may be completely shut off when the EPO is pressed. REPO function

(Remote EPO) is also available in this series UPS.

## 3. Installation

### 3.1 Unpacking and checking

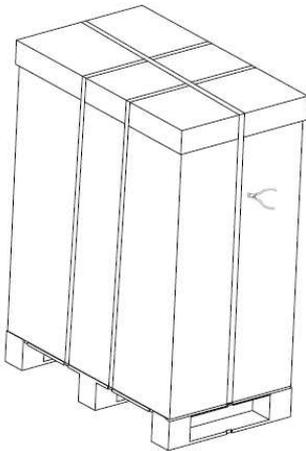

**Don't lean the UPS when moving it out from the packaging**

#### Procedure

**Step 1** Use a pallet truck to transport the UPS to the installation position.

**Step 2** Check the UPS packing.

**Step 3** Hold the sliding plate steady. Cut and remove the binding tapes.

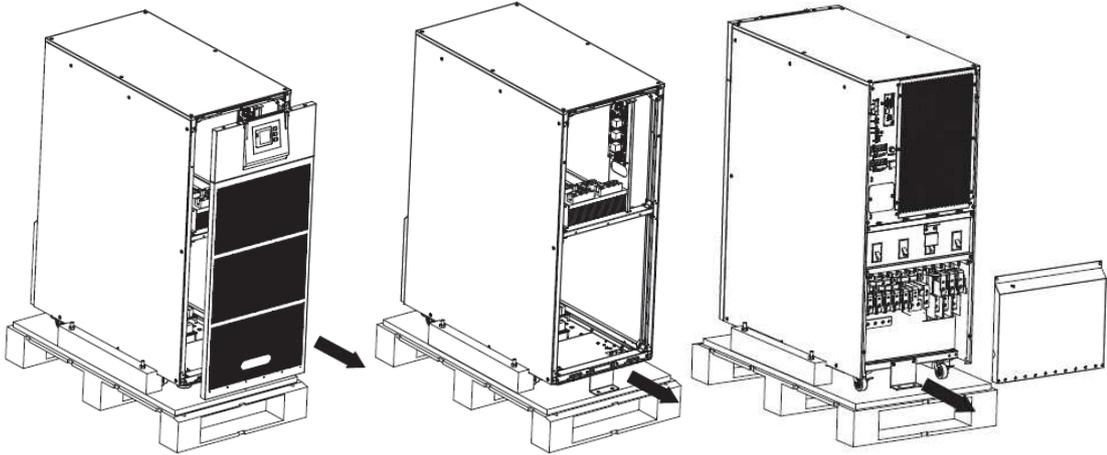

**Step 5** Remove the plastic bag and take out the fittings box.

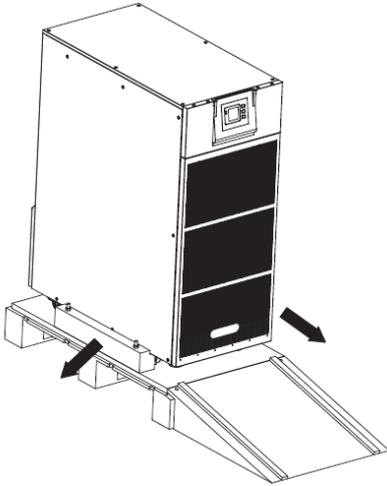

**Step 6** Check that the UPS is intact.

1. Visually inspect the UPS appearance for shipping damage. If it is damaged, notify the carrier immediately.
2. Check the accessories according to the packing list and contact the dealer in case of missing parts.

**Step 7** Remove the front panel and rear panel to remove the L-shaped bracket that secures the cabinet and the pallet, and secure the sliding

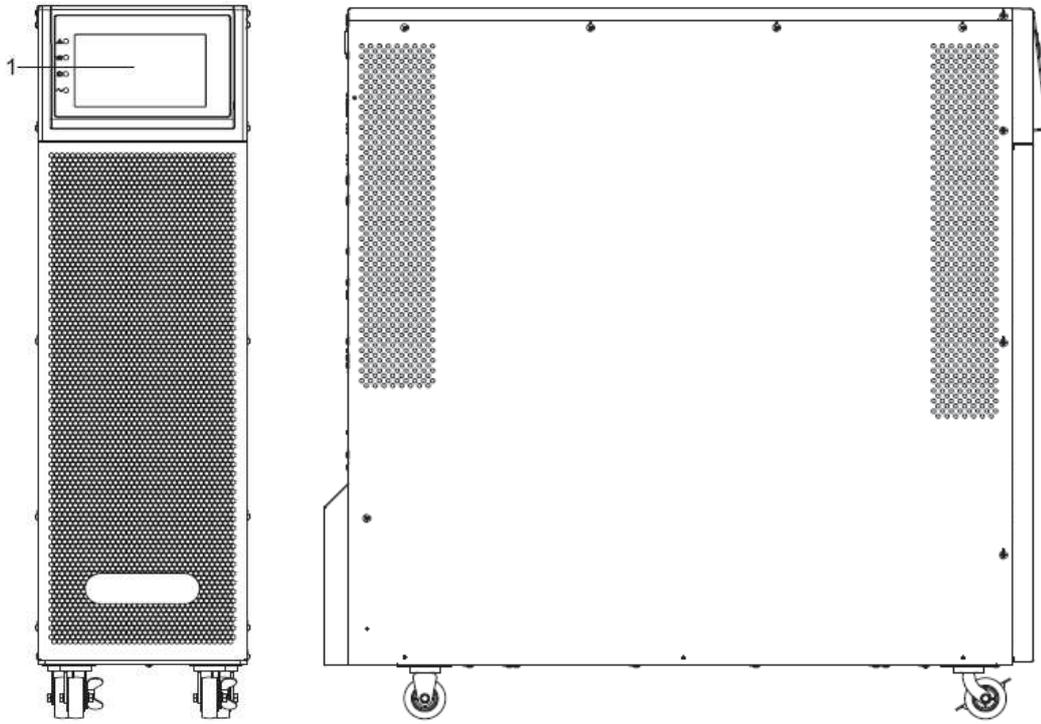

**Step 8** Remove the front panel and rear panel to remove the L-shaped bracket and the plates at the left and right side of the UPS that secures the cabinet and the pallet, and secure the sliding

### 3.3 LCD control panel

**LCD control panel introduction**

- (1) LED (from top to bottom: "Fault", "bypass", "battery", "inverter")
- (2) LCD display

### 3.4 Installation notes

Note: Consider for the convenience of operation and maintenance, the space in front and back of the cabinet should be left at least 100cm and 80cm respectively when installing the cabinet.

◆ Please place the UPS in a clean, stable environment, avoid the vibration, dust, humidity, flammable gas and liquid, corrosive. To avoid from high room temperature, a system of room extractor fans is recommended to be installed. Optional air filters are available if the UPS operates in a dusty environment.

◆ The environment temperature around UPS should keep in a range of 0°C~40°C. If the environment temperature exceeds 40°C, the rated load capacity should be reduced by 12% per

5°C. The max temperature can't be higher than 50°C.

◆ If the UPS is dismantled under low temperature, it might be in a condensing condition. The UPS can't be installed unless the internal and external of the equipment is fully dry. Otherwise, there will be in danger of electric shock.

◆ Batteries should be mounted in an environment where the temperature is within the required specs. Temperature is a major factor in determining battery life and capacity. In a normal installation, the battery temperature is maintained between 15°C and 25°C. Keep batteries away from heat sources or main air ventilation area, etc.

### WARNING!

**Typical battery performance data are quoted for an operating temperature between 20°C and 25°C. Operating it above this range will reduce the battery life while operation below this range will reduce the battery capacity.**

◆ Should the equipment not be installed immediately it must be stored in a room so as to protect it against excessive humidity and or heat sources.

### CAUTION!

**An unused battery must be recharged every 6months Temporarily connecting the UPS to a suitable AC supply mains and activating it for the time required for recharging the batteries.**

◆ The highest altitude that UPS may work normally with full load is 1500 meters. The load capacity should be reduced when this UPS is installed in place whose altitude is higher than 1500 meters, shown as the following table:

(Load coefficient equals max load in high altitude place divided by nominal power of the UPS)

| Altitude (m)     | 1500 | 2000 | 2500 | 3000 | 3500 | 4000 | 4500 | 5000 |
|------------------|------|------|------|------|------|------|------|------|
| Load coefficient | 100% | 95%  | 90%  | 85%  | 80%  | 75%  | 70%  | 65%  |

◆ The UPS cooling is depending on fan, so it should be kept in good air ventilation area. There are many ventilation holes on the front and rear, so they should not be blocked by any exotic obstacles.

## 3.5 External Protective Devices

For safety reasons, it is necessary to install, external circuit breaker at the input A.C. supply and the battery. This chapter provides guidelines for qualified installers that must have the knowledge of local wiring practices for the equipment to be installed.

If the protection against electric shock of the system where the UPS is installed is based on differential current devices, the devices must be type B, ID min. 300mA, delay  $\geq$  to 0.1s.

### ◆ External Battery

The UPS and its associated batteries are protected against the effect of over-current through a DC compatible thermo-magnetic circuit-breaker (or a set of fuses) located close to the battery.

### ◆ UPS Output

Any external distribution board used for load distribution shall be fitted with protective devices that may avoid the risk of UPS overloaded.

### ◆ Over-current

Protection device shall be installed at the distribution panel of the incoming main supply. It may identify the power cables current capacity as well as the overload capacity of the system.

**CAUTION!**

Select a thermo magnetic circuit-breaker with an IEC 60947-2 trip curve C (normal) for 125% of the current as listed below.

**3.6 Power Cables**

◆ The cable design shall comply with the voltages and currents provided in this section, Kindly follow local wiring practices and take into consideration the environmental conditions (temperature and physical support media) .

**WARNING!**

Upon starting. Please ensure that you are aware of the location and operation of the external isolators which are connected to the UPS input/bypass supply of the mains distribution panel. Check to see if these supplies are electrically isolated. And post and necessary warning signs to prevent any inadvertent operation.

**3.6.1 Recommended cross-sectional areas for power cables**

| UPS cabinet | Cable Dimension             |                              |                             |                              |
|-------------|-----------------------------|------------------------------|-----------------------------|------------------------------|
|             | AC Input (mm <sup>2</sup> ) | AC Output (mm <sup>2</sup> ) | DC Input (mm <sup>2</sup> ) | Grounding (mm <sup>2</sup> ) |
| 50kVA       | 25                          | 25                           | 50                          | 25                           |
| 60kVA       | 35                          | 35                           | 50                          | 35                           |
| 80kVA       | 50                          | 50                           | 95                          | 35                           |
| 100kVA      | 70                          | 50                           | 120                         | 35                           |
| 120kVA      | 95                          | 70                           | 150                         | 50                           |
| 150kVA      | 120                         | 95                           | 185                         | 70                           |
| 160kVA      | 120                         | 95                           | 185                         | 70                           |
| 200kVA      | 150                         | 120                          | 120*2                       | 95                           |

- ◆ When selecting, connecting, and routing power cables, follow local safety regulations and rules.
- ◆ If external conditions such as cable layout or ambient temperatures change, perform verification in accordance with the IEC-60364-5-52 or local regulations.
- ◆ If the rated voltage is 400 V, multiply the currents by 0.95. If the rated voltage is 415 V, multiply the currents by 0.92.
- ◆ If primary loads are non-linear loads, increase the cross-sectional areas of neutral wires 1.5–1.7 times.
- ◆ The nominal battery discharge current refers to the current of forty 12 V batteries at 480V in standard configuration.
- ◆ The maximum battery discharge current refers to the current when forty 12 V batteries in standard configuration, that is, two hundred and forty 2 V battery cells (1.67 V/cell), stop discharging.
- ◆ The battery cable specifications are selected based on 40 batteries by default and compatible with application scenarios with 30–50 batteries.
- ◆ When the mains input and bypass input share a power source, configure both types of input power cables as mains input power cables. The cables listed in Table are used only when the following requirements are met:
  - Routing mode: Routing the cables over the cable ladder or bracket in a single layer (IEC60364-5-52 middle E).

- The ambient temperature is 30°C.
- The AC voltage loss is less than 3%, and the DC voltage loss is less than 1%.
- 90°C copper flexible cable.
- The length of the AC power cables of a UPS is no longer than 30 m and DC power cables no longer than 50 m.

### 3.6.2 Power cable connector requirements

| Model      | Connector               | Connection Mode      | Bolt Type | Bolt Hole Diameter | Torque |
|------------|-------------------------|----------------------|-----------|--------------------|--------|
| 50-60kVA   | Mains input connector   | Crimped OT terminals | M8        | 9mm                | 20N•m  |
|            | Bypass input connector  | Crimped OT terminals | M8        | 9mm                | 20N•m  |
|            | Battery input connector | Crimped OT terminals | M10       | 11mm               | 20N•m  |
|            | Output connector        | Crimped OT terminals | M8        | 9mm                | 20N•m  |
|            | Grounding connector     | Crimped OT terminals | M8        | 9mm                | 20N•m  |
| 80-120kVA  | Mains input connector   | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Bypass input connector  | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Battery input connector | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Output connector        | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Grounding connector     | Crimped OT terminals | M10       | 11mm               | 26N•m  |
| 150-160kVA | Mains input connector   | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Bypass input connector  | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Battery input connector | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Output connector        | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Grounding connector     | Crimped OT terminals | M10       | 11mm               | 26N•m  |
| 200kVA     | Mains input connector   | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Bypass input connector  | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Battery input connector | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Output connector        | Crimped OT terminals | M10       | 11mm               | 26N•m  |
|            | Grounding connector     | Crimped OT terminals | M10       | 11mm               | 26N•m  |

### 3.6.3 Recommended input front-end and output back-end circuit breakers

| UPS capacity  | Component                    | Specifications |
|---------------|------------------------------|----------------|
| 50kVA         | Mains input circuit breaker  | 100A 3P        |
|               | Bypass input circuit breaker | 100A 3P        |
|               | Output circuit breaker       | 100A 3P        |
|               | Battery circuit breaker      | 160A 3P        |
| 60kVA         | Mains input circuit breaker  | 125A 3P        |
|               | Bypass input circuit breaker | 125A 3P        |
|               | Output circuit breaker       | 125A 3P        |
|               | Battery circuit breaker      | 200A 3P        |
| 80kVA         | Mains input circuit breaker  | 160A 3P        |
|               | Bypass input circuit breaker | 160A 3P        |
|               | Output circuit breaker       | 160A 3P        |

**CAUTION!**

**Protective earth cable: Connect each cabinet to the main ground system. For Grounding connection, follow the shortest route possible.**

**WARNING!**

**Failure to follow adequate earthing procedures may result in electromagnetic interference or in hazards involving electric shock and fire**

### 3.7 Power cable connect

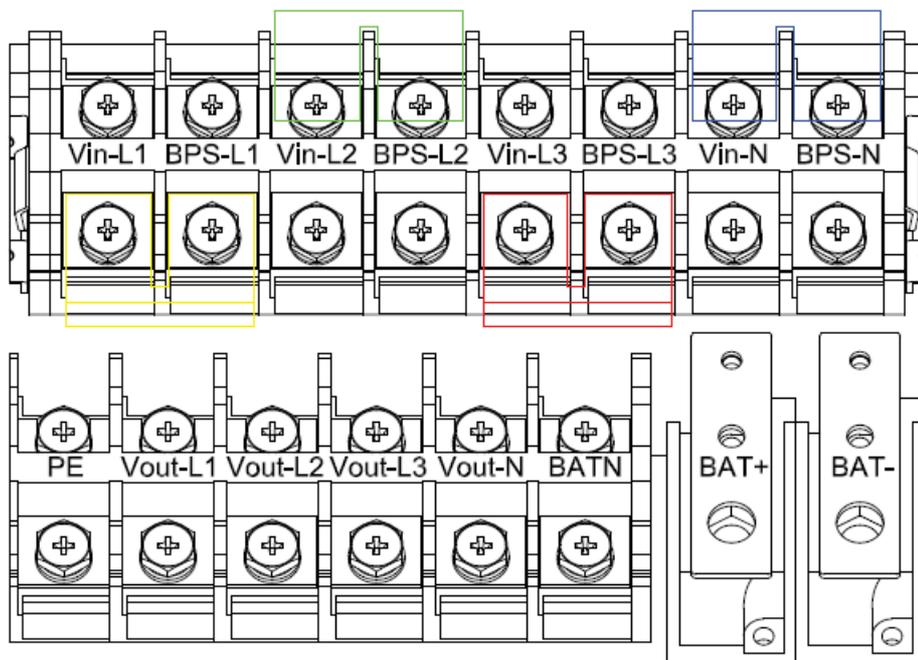

Once the equipment has been finally positioned and secured, connect the power cables as described in the following procedure.

Verify the UPS is totally isolated from its external power source and also all power isolators of the UPS are open. Check to see if they are electrically isolated, and post any necessary warning signs to prevent their inadvertent operation.

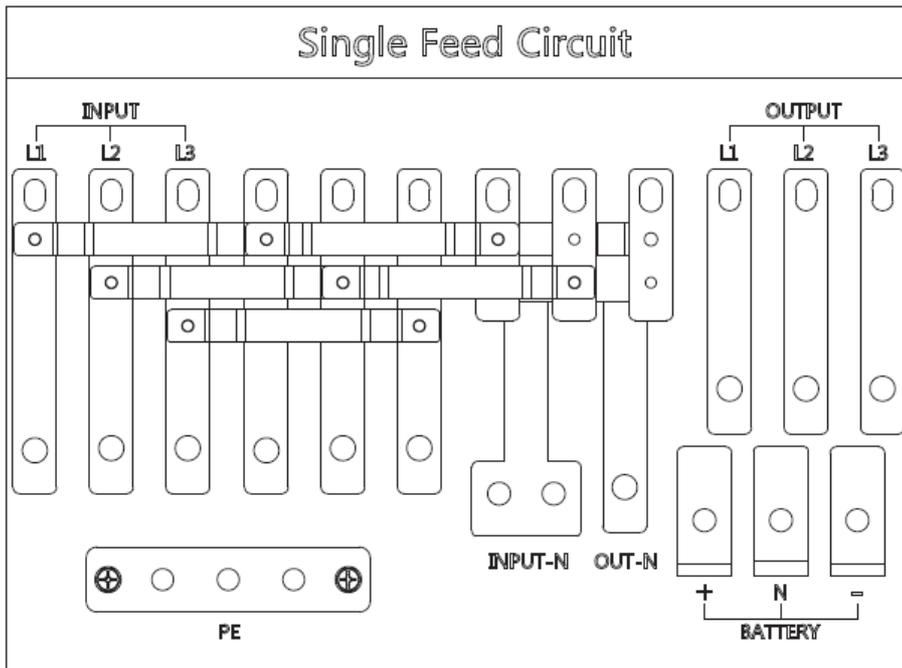

Open the UPS rear panel; Remove the cover of terminals for wiring easily.

#### 3.7.1 Common input connection

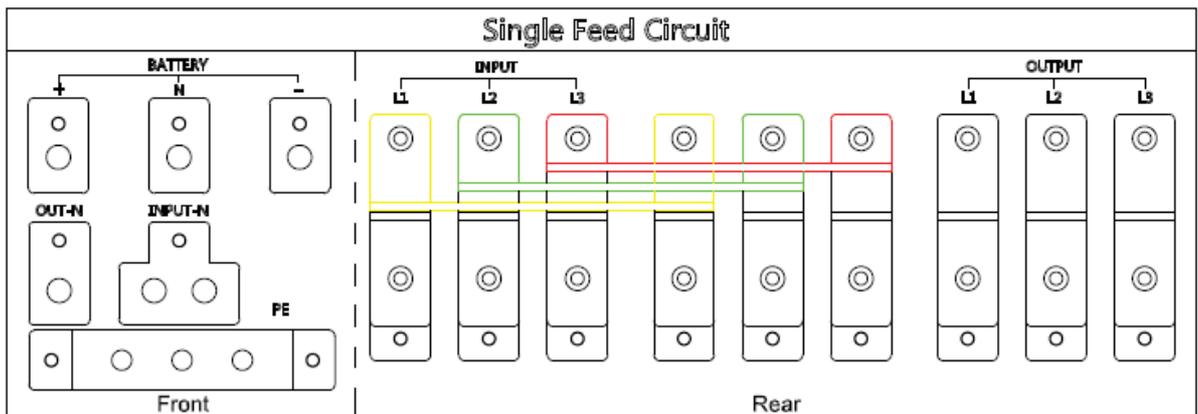

##### 50kVA&60kVA

### 80kVA-160 kVA

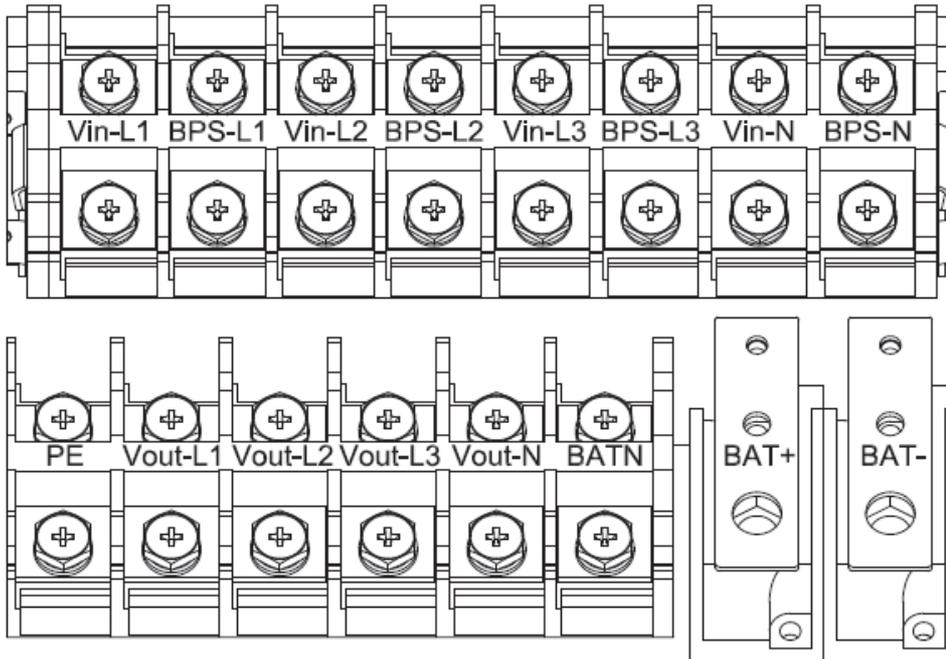

### 200 kVA

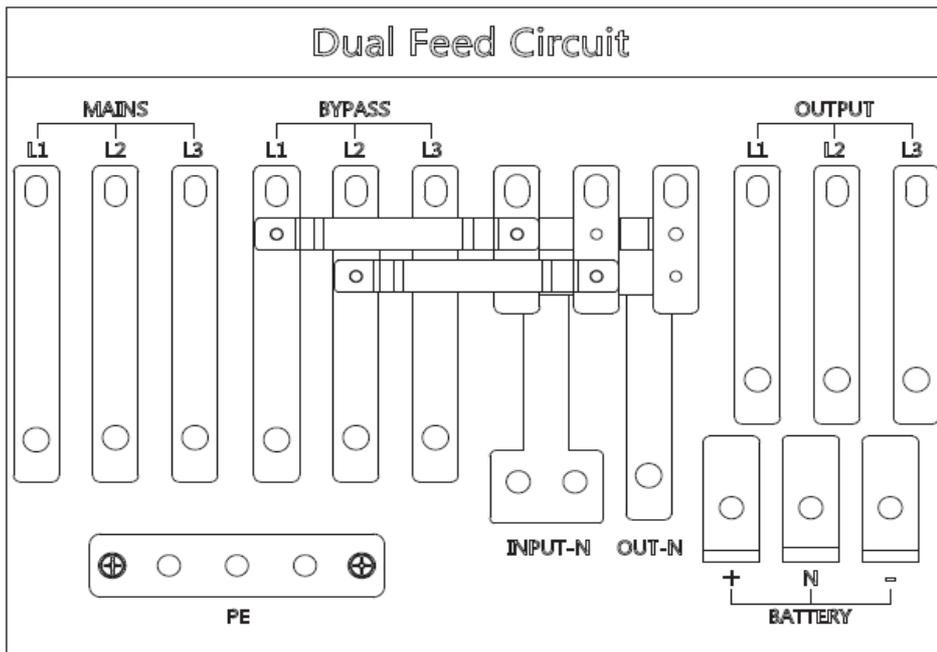

| INPUT Primary input Line                                    | OUTPUT   |
|---|--|
|   | <b>Vout-L1:</b> Output Phase L1                        |
| <b>Vin-L1:</b> Primary input Phase L1                       | <b>Vout -L2:</b> Output Phase L2                       |

| <b>Vin-L3:</b> Primary input Phase L3                       | <b>Vout-N:</b> Output Neutral                          |
| <b>Vin-N:</b> Input Neutral for primary and secondary input | <b>PE:</b> Grounding                                   |
| <b>BPS-L1:</b> Secondary input Phase L1                     | <b>BAT+:</b> Positive terminal of the batteries string |
| <b>BPS-L2:</b> Secondary input Phase L2                     | <b>BATN:</b> Neutral terminal of the batteries string  |
| <b>BPS-L3:</b> Secondary input Phase L3                     | <b>BAT-:</b> Negative terminal of the batteries string |

### Warning!

In the case of “Dual input” operation, make sure the copper wire between each input lines have been removed. The AC input and the AC bypass supplies must be referenced to the same neutral point.

Choose appropriate power cable. (Refer to the table above) and pay attention to the diameter of the connection terminal of the cable that should be greater than or equal to that of the connection poles;

### WARNING!

If the load equipment is not ready to accept power on the arrival of the commissioning engineer then ensure that the system output cables are safely isolated at their ends

Connect the safety earth and any necessary bonding earth cables to the copper earth screw located on the floor of the equipment below the power connections. All cabinets in the UPS must be grounded properly.

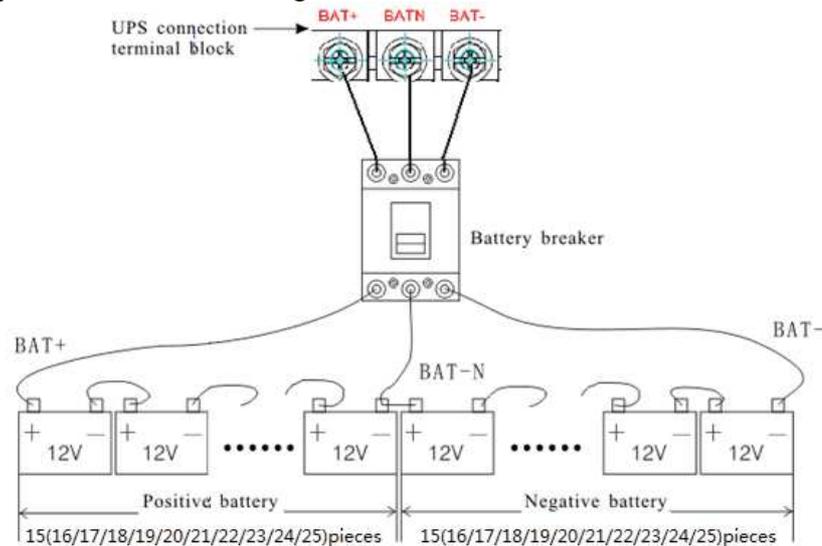

### CAUTION!

The earthing and neutral bonding arrangement must be in accordance with local and national codes of practice.

### 3.8 Battery connection

The UPS adopts positive and negative double battery framework, total 30(optional 32/34/36/38/40/42/44/46/48/50) in series. A neutral cable is retrieved from the joint between the negative pole of the 15<sup>th</sup> (16<sup>th</sup>/17<sup>th</sup>/18<sup>th</sup>/19<sup>th</sup>/20<sup>th</sup>/21<sup>th</sup>/22<sup>th</sup>/23<sup>th</sup>/24<sup>th</sup>/25<sup>th</sup>) and the positive pole of the 16<sup>th</sup> (17<sup>th</sup>/18<sup>th</sup>/19<sup>th</sup>/20<sup>th</sup>/21<sup>th</sup>/22<sup>th</sup>/23<sup>th</sup>/24<sup>th</sup>/25<sup>th</sup>/26<sup>th</sup>) of the batteries. Then the neutral cable, the battery Positive and the battery negative are connected with the UPS respectively. The battery sets between the Battery positive and the neutral are called positive batteries and that between neutral and negative are called negative ones. The user can choose the capacity and the numbers of the batteries according to their desire.

External battery connections for long-run units.

Note:

The BAT + of the UPS connection poles is connected to the positive terminal of the positive battery, the BAT-N is connected between the negative terminal of the positive battery and the positive terminal of the negative battery, the BAT- is connected to the negative terminal of the battery negative.

Factory setting of the long-run unit is battery quantity---40pcs, battery capacity---12V100AH (charger current 15A). When connecting 30/32/34/36/38/42/44/46/48/50 batteries, please re-set desired battery quantity and its capacity after UPS starts at AC mode. Charger current could be adjusted automatically according to battery capacity selected. All related settings can be done through LCD panel or monitoring software

#### CAUTION!

Ensure correct polarity battery string series connection. I.e. inter-tier and inter block connections are from (+) to (-) terminals. Don't mix batteries with different capacity or different brands, or even mix up new and old batteries, either.

#### WARNING!

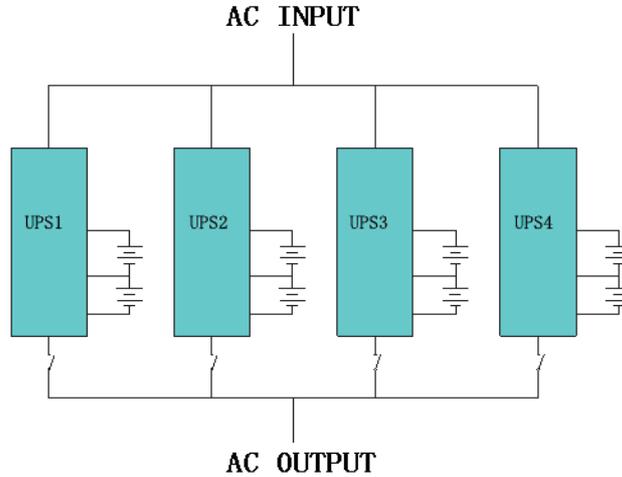

Ensure correct polarity of string end connections to the Battery Circuit Breaker and from the Battery Circuit Breaker to the UPS terminals i.e. (+) to (+) / (-) to (-) but disconnect one or more battery cell links in each tier. Do not reconnect these links and do not close the battery circuit breaker unless authorized by the commissioning engineer.

### 3.9 UPS parallel Installation

The following sections introduce the installation procedures specified to the parallel system.

#### 3.9.1 Cabinet installation

Connect all the UPS needed to be put into parallel system as below picture.

Make sure each UPS input breaker is in “off” position and there is no any output from each UPS connected. Battery groups can be connected separately or in parallel, which means the system itself provides both separate battery and common battery.

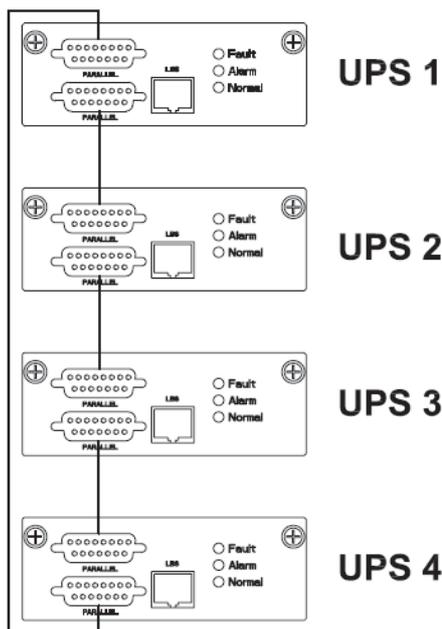

#### WARNING!

Make sure the N, A (L1), B (L2), C (L3) lines are correct, and grounding is well connected.

#### 3.9.2 Parallel cable installation

Shielded and double insulated control cables, available 5 meters long as a standard, must be interconnected in a ring configuration between UPS units as shown below. The ring configuration ensures high reliability of the control.

### 3.9.3 Requirement for the parallel system

A group of paralleled UPS behaves as one large UPS system but with the advantage of presenting higher reliability. In order to assure that all UPS are equally utilized and comply with relevant wiring rules, please follow the requirements below:

- 1) All UPS must be of the same rating and be connected to the same bypass source.
- 2) The outputs of all the UPS must be connected to a common output bus.
- 3) The length and specification of power cables including the bypass input cables and the UPS output cables should be the same. This facilitates load sharing when operating in bypass mode.

### 3.10 LBS installation

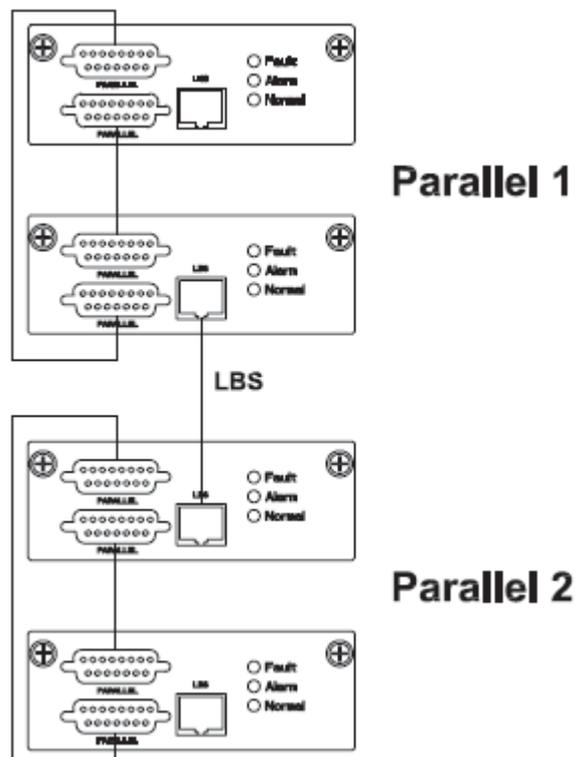

LBS system contains LCD set, communication cable and STS device.

#### 3.10.1 LCD setting

Set every UPS of the systems to be LBS Master or LBS Slave. For instance if the UPS belongs to LBS master system, its LBS setting must be set to Master.

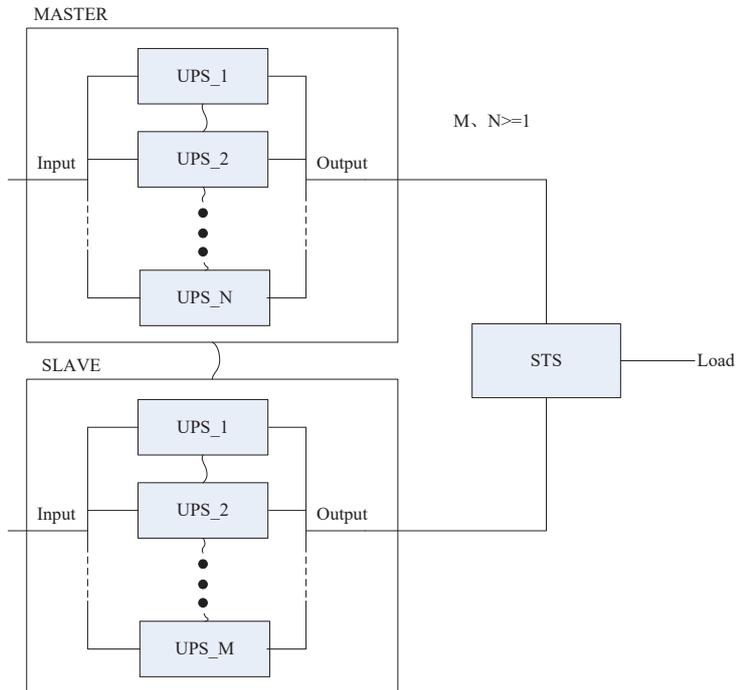

#### 3.10.2 LBS cable installation

The two ports of one mesh wire should be plug into RJ45 interface of any one UPS of both master and slave system.

### 3.10.3 UPS installation

The whole systems is showed below.

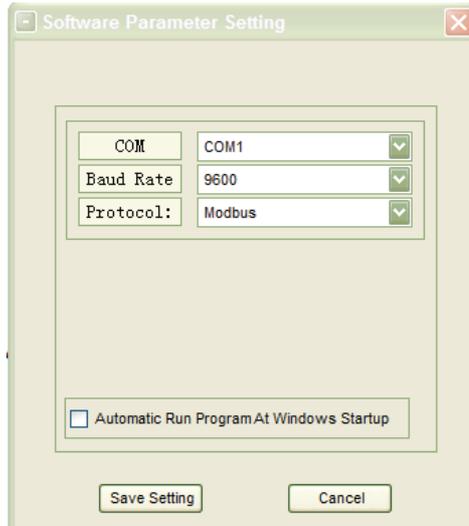

### 3.11 Computer access

- ◆ One end of a USB cable connect to the computer, the other end connect to the USB port on the UPS.
- ◆ Open the software Muser5000, click “system” button.

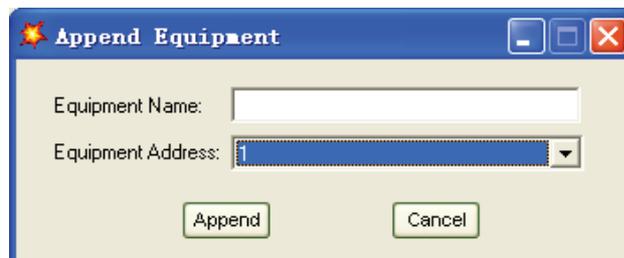

- ◆ A window of “Software Parameter Setting” comes out as below, COM choose according to the UPS , baud rate choose 9600, protocol choose “modbus”, then save this setting.

◆ On the main page of Muser5000, click the button of “Append”, then goes to a window of “Append equipment”.

◆ Put the UPS name into “Equipment Name”, and UPS’ ID address into “Equipment address”.

◆ Click the button “Append”, then the connection between UPS & computer is accomplished.

**CAUTION!**

**When the UPS worked on inverter. If you want to use PC to set the output voltage and frequency. Must shut down the inverter first**

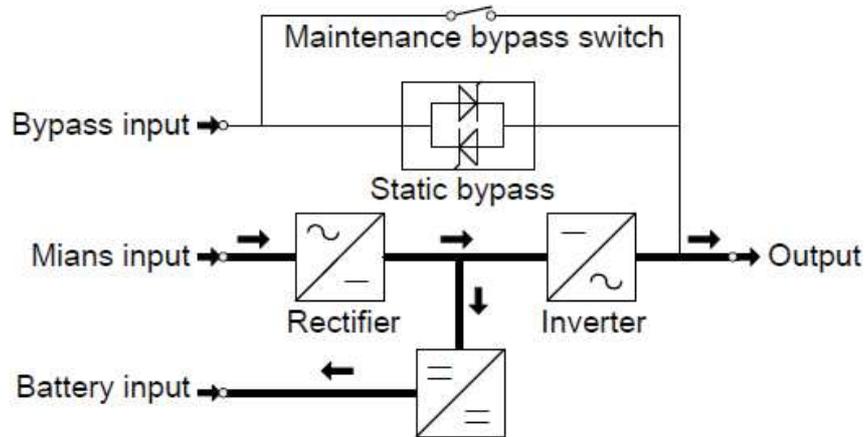

## 4. Operation

### 4.1 Operation Modes

The UPS is a double-conversion on-line UPS that may operate in the following alternative modes:

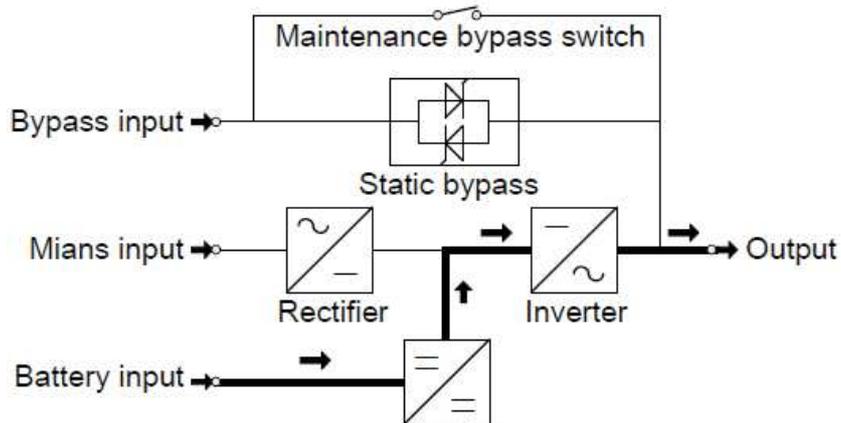

#### ◆ Normal mode

The rectifier/charger derives power from the AC Mains and supplies DC power to the inverter while floating and boosting charge the battery simultaneously. Then, the inverter converts the DC power to AC and supplies to the load.

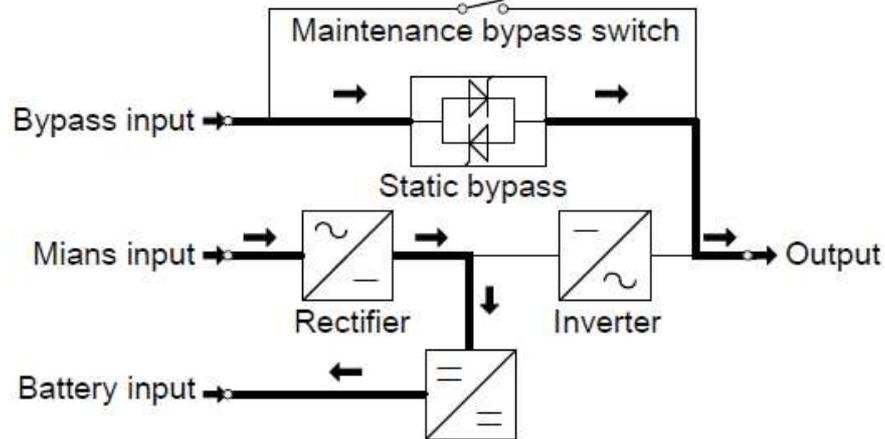

#### ◆ Battery mode (Stored Energy Mode)

If the AC mains input power fails, the inverter, which obtains power from the battery, supplies the critical AC load. There is no power interruption to the critical load. The UPS will automatically return to Normal Mode when AC recovers.

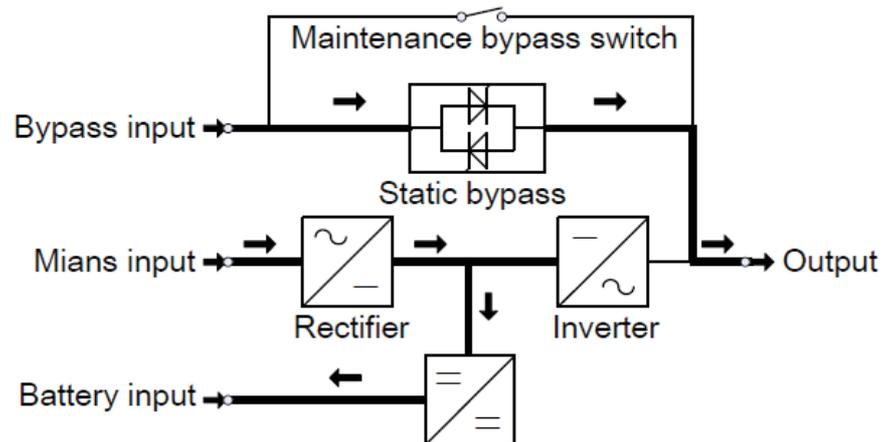

#### ◆ Bypass mode

If the inverter is out of order, or if overload occurs, the static transfer switch will be activated to transfer the load from the inverter supply to bypass supply without interruption to the critical load. In the event that the inverter output is not synchronized with the bypass AC source, the static switch will perform a transfer of the load from the inverter to the bypass with power interruption to the critical AC load. This is to avoid paralleling of unsynchronized AC sources. This interruption is programmable but typically set to be less than an electrical cycle e.g. less than 15ms (50Hz) or less than 13.33ms (60Hz).

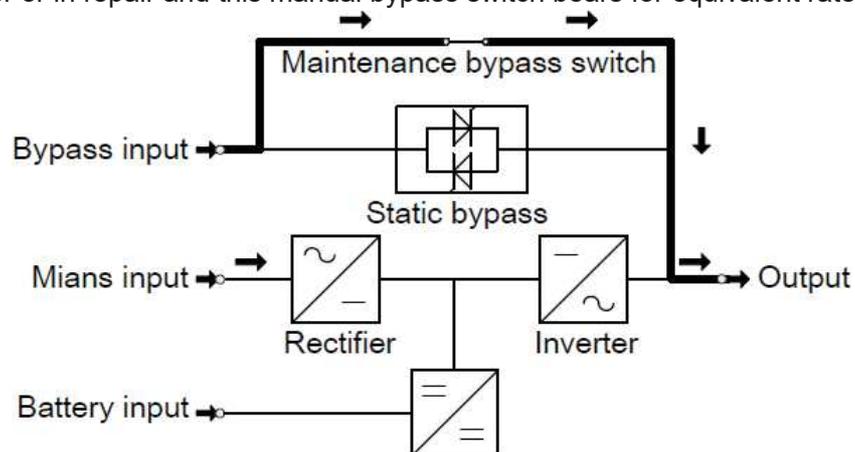

◆ **ECO Mode**

When the UPS is at AC Mode and the requirement to the load is not critical, the UPS can be set at ECO mode in order to increase the efficiency of the power supplied. At ECO mode, the UPS works at Line-interactive mode, so the UPS will transfer to bypass supply. When the AC is out of set window, the UPS will transfer from bypass to Inverter and supplies power from the battery, and then the LCD shows all related information on the screen.

◆ **Maintenance mode (Manual Bypass)**

A manual bypass switch is available to ensure continuity of supply to the critical load when the UPS is out of order or in repair and this manual bypass switch bears for equivalent rated load.

## 4.2 Turn on/off UPS

### 4.2.1 Restart procedure

#### CAUTION!

MAKE SURE GROUNDING IS PROPERLY DONE!

- ◆ Set the Battery Breaker to the “ON” position according to the user’s manual.

#### CAUTION!

Check to see if the load is safely connected with the output of the UPS. If the load is not ready to receive power from the UPS, make sure that it is safely isolated from the UPS output terminals

- ◆ Turn ON OUTPUT breaker. (Below the UPS power units at the front door)
- ◆ Turn ON BYPASS breaker and MAINS breaker. (Below the UPS power units at the front door)

If the Rectifier input is within voltage range, the rectifier will start up in 30 seconds then the inverter will start up after then.

If the rectifier fails at startup, the bypass LED will light up. When the inverter starts up, the UPS will transfer from bypass mode to inverter mode, then the bypass LED extinguishes and the inverter LED lights up.

No matter whether the UPS can work normally or not, all the status will be shown on the LCD display.

### 4.2.2 Test procedure

#### CAUTION!

The UPS is operating normally. It may take 60 seconds to boost up the system and perform self-test completely.

- ◆ Switch off the MAINS to simulate utility failure, the rectifier will turn off and the battery should feed the inverter without interruption. At this time, the LEDs of battery should be turned on.
- ◆ Switch on the MAINS to simulate utility recovery, the rectifier will restart automatically after 20 seconds and the inverter will supply to the load. It is suggested to use Dummy loads for testing. The UPS can be loaded up to its maximum capacity during load test.

### 4.2.3 MAINTENANCE BYPASS

To supply the load via Mains, you may simply active the internal mechanical bypass switch.

#### CAUTION!

The load is not protected by the UPS when the internal mechanical bypass system is active and the power is not conditioned.

#### Switch to mechanical bypass

#### CAUTION!

If the UPS is running normally and can be controlled through the display, carry out steps 1 to 6; otherwise, jump to Step 5.

- ◆ Open the cover of maintenance switch, the UPS turns to bypass mode automatically.
- ◆ Turn on MAINTANCE breaker;
- ◆ Switch OFF BATTERY breaker;
- ◆ Switch OFF MAINS breaker;
- ◆ Switch OFF BYPASS breaker;
- ◆ Switch OFF OUTPUT breaker;

At this time the bypass source will supply to the load through the MAINTENANCE breaker.

### Switch to normal operation (from mechanical bypass)

#### CAUTION!

Never attempt to switch the UPS back to normal operation until you have verified that there are no internal UPS faults.

- ◆ Turn ON OUTPUT breaker.
- ◆ Turn ON BYPASS breaker.
- ◆ Turn ON MAINS breaker.

The UPS powers from the static bypass instead of the maintenance bypass, then the bypass LED will light up.

- ◆ Switch OFF the maintenance bypass breaker, then the output is supplied by the static bypass of the UPS.
- ◆ Put on the maintenance switch cover.

The rectifier will operate normally after 30 seconds. If the inverter works normally, the system will be transferred from bypass mode to normal mode.

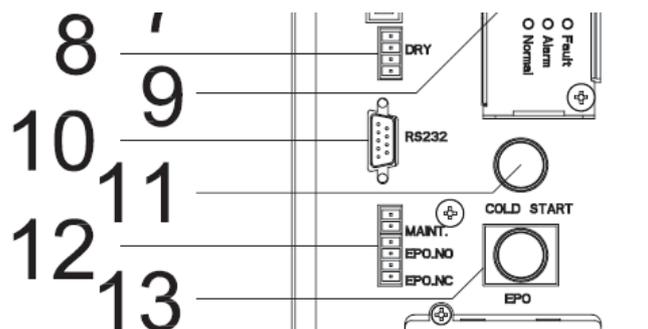

### 4.2.4 Cold start procedure

#### CAUTION!

Follow these procedures when the input AC Utility Failure, but battery is normal

- ◆ Turn on the BATTERY breaker.  
The battery will feed the Auxiliary power board.
- ◆ Turn on the OUTPUT breaker.
- ◆ Trigger the cold start(Cold start) button as the position 11 of the below drawing.

When battery normal, rectifier starts operation, 30s later, inverter starts and operates and battery LED on.

**CAUTION!**

Please press the close start button after 30 seconds until closing the battery switch.

**4.2.5 Shut down procedure**

**CAUTION!**

This procedure should be followed to completely shut down the UPS and the LOAD. After all power switches, isolators and circuit breakers are opened, there will be no output.

- ◆ Switch OFF the BATTERY breaker;
- ◆ Open the UPS door to easily access to the main power switch;
- ◆ Switch OFF the MAINS breaker.
- ◆ Switch OFF the BYPASS breaker.
- ◆ Open the OUTPUT breaker. The UPS shuts down;
- ◆ To completely isolate the UPS from AC Mains, all input switches of Utility shall be completely off, which includes the ones for rectifier and bypass.
- ◆ The primary input distribution panel, which is often located far away from the UPS area, so a label should be posted to advise service personnel that the UPS circuit is under maintenance.

**WARNING!**

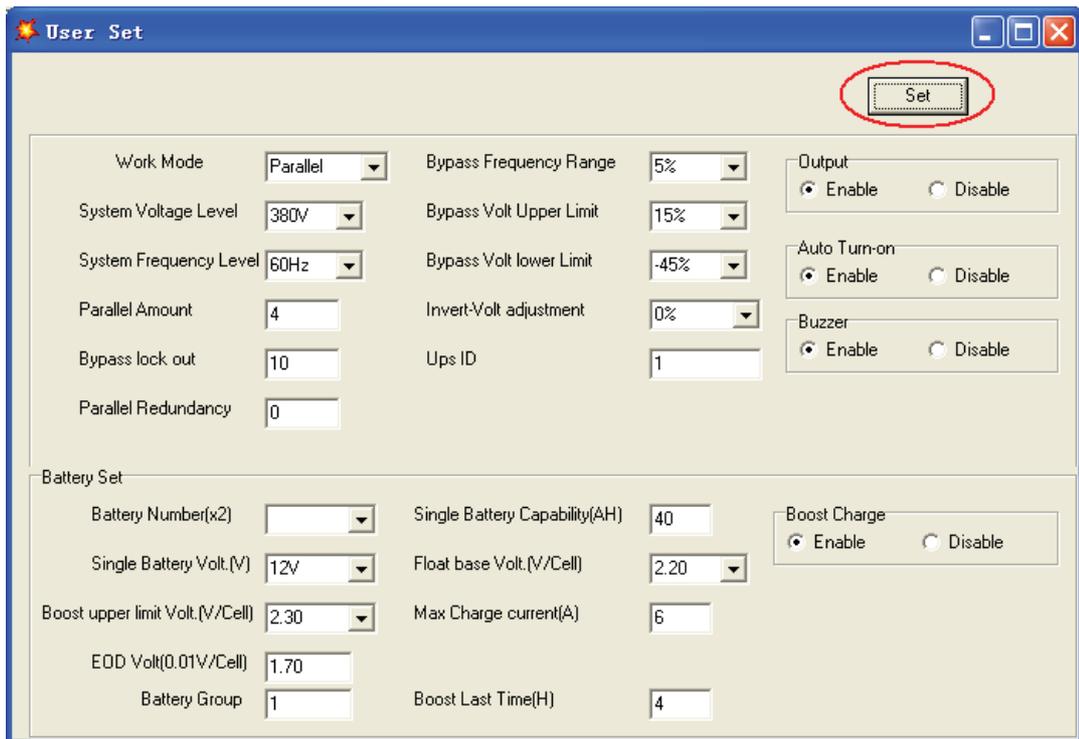

Wait for about 5 minutes for the internal D.C. bus bar capacitors to be completely discharged.

**4.2.6 Parallel setting**

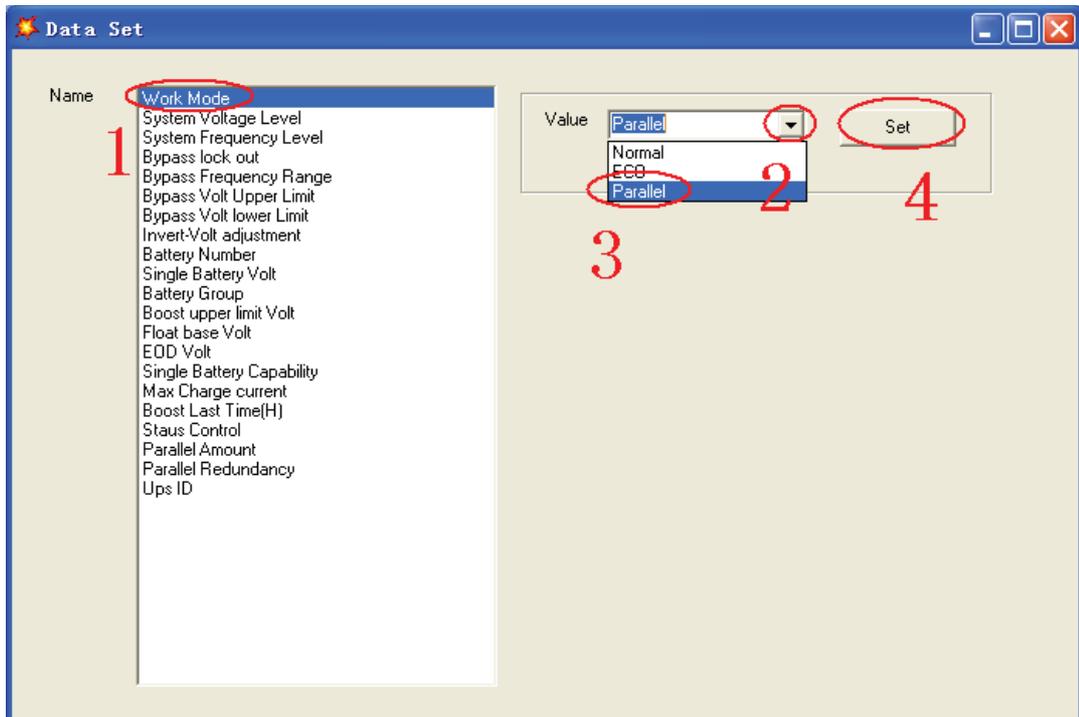

- ◆ Connect the UPS with computer. Power on the UPS.
- ◆ Open Muser5000 software, after connecting with the UPS successfully, click “System”->“User Set”

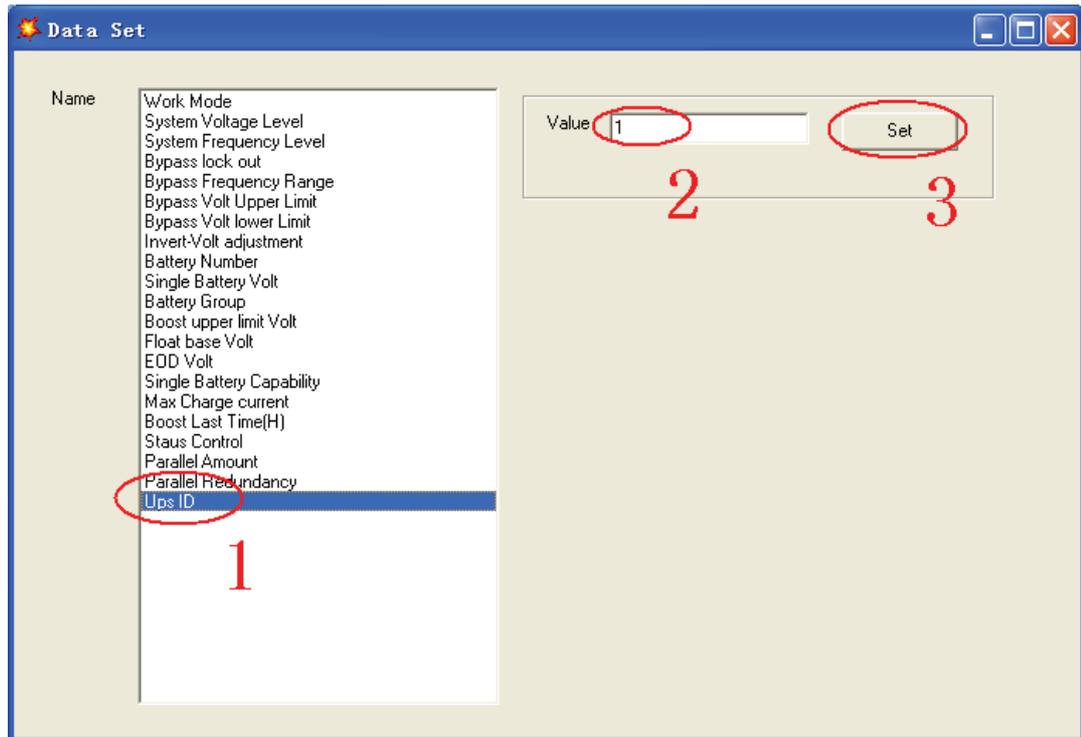

◆Click “Set” at “User Set” window;

◆At the window of “Data Set”, click “Work Mode”, choose “Parallel” for the value, then click “Set” as shown in below picture. If the UPS sounds a “beep”, that means the setting is correct.

◆At the window of “Data Set”, click “Ups ID”, write a value for the parallel UPS ID at the right side, such as “1”, then click “Set” as shown in below picture. If the UPS sounds a “beep”, that means the setting is correct.

**CAUTION!**

After changing the parallel system ID, the connection between Muser5000 and equipment might be interrupted. If it occurs, please re-connect in accordance with the instruction described before.

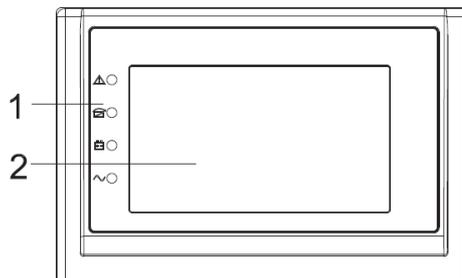

**CAUTION!**

Parallel cable cannot be connected when setting the parallel parameters.

- ◆ After setting the UPS needed to be paralleled, power off all the UPS. Connect all the UPS according to “parallel cable installation”, and then power on the UPS.

**4.3 The LCD Display**

**LCD control panel introduction**

(1) LED (from top to bottom: “Fault”, “bypass”, “battery”, “inverter”)

(2) LCD display

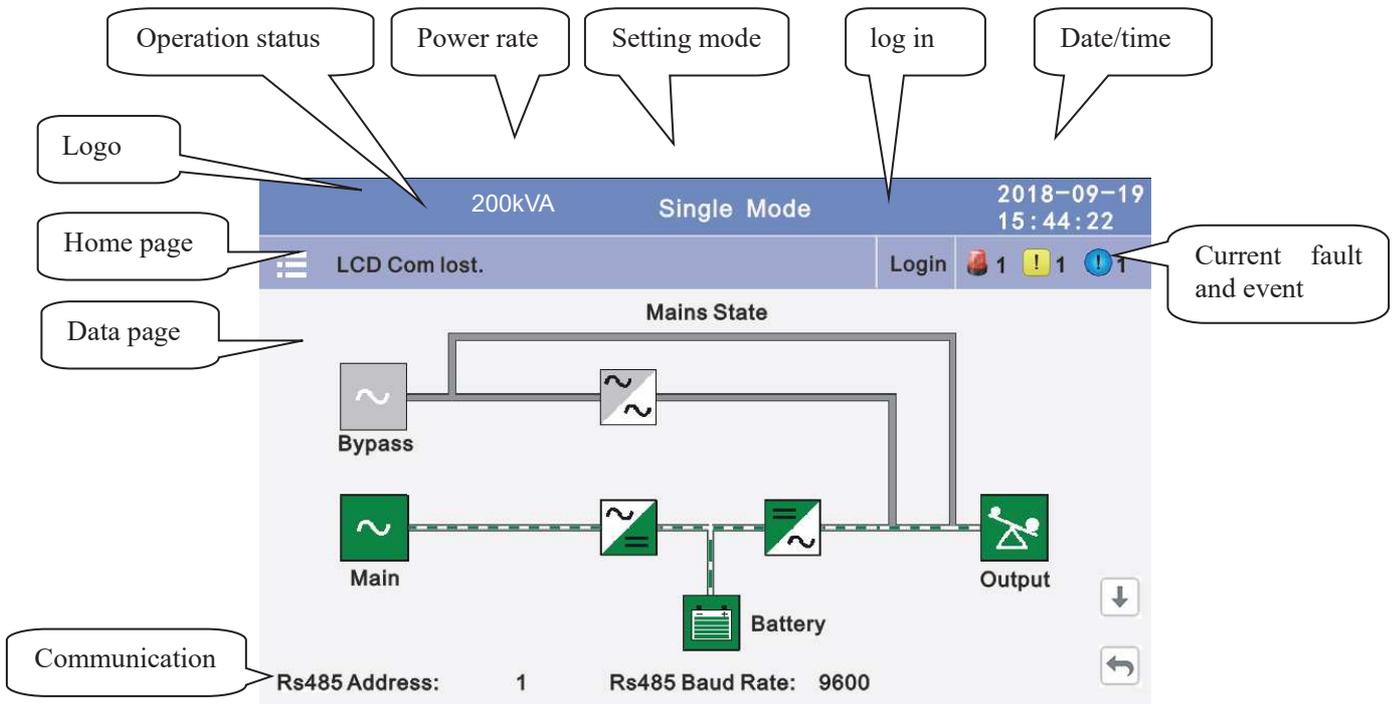

**Introduction**

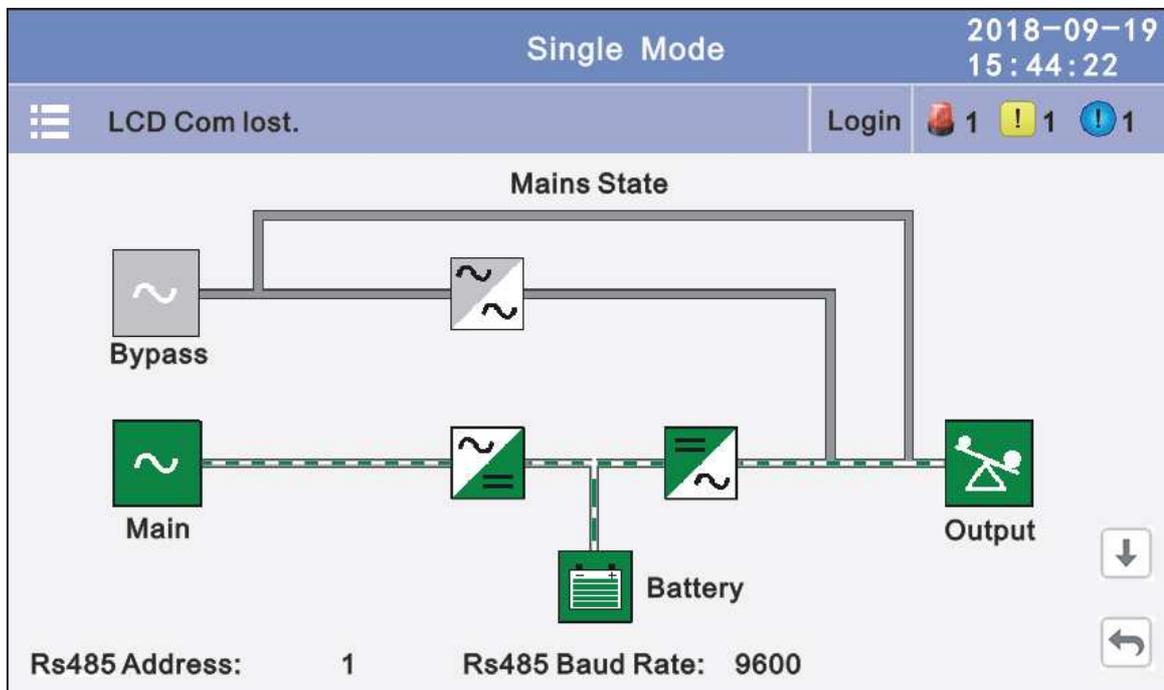

**CAUTION!**

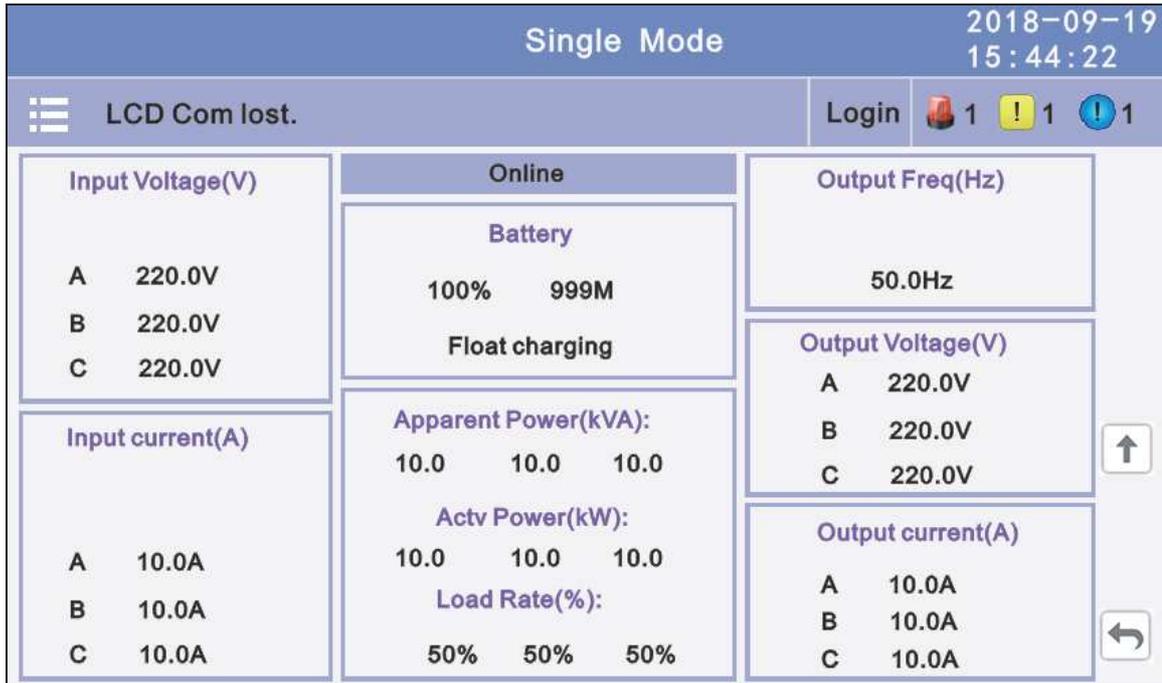

The display provides more functions than those described in this manual.

### 4.3 The Display

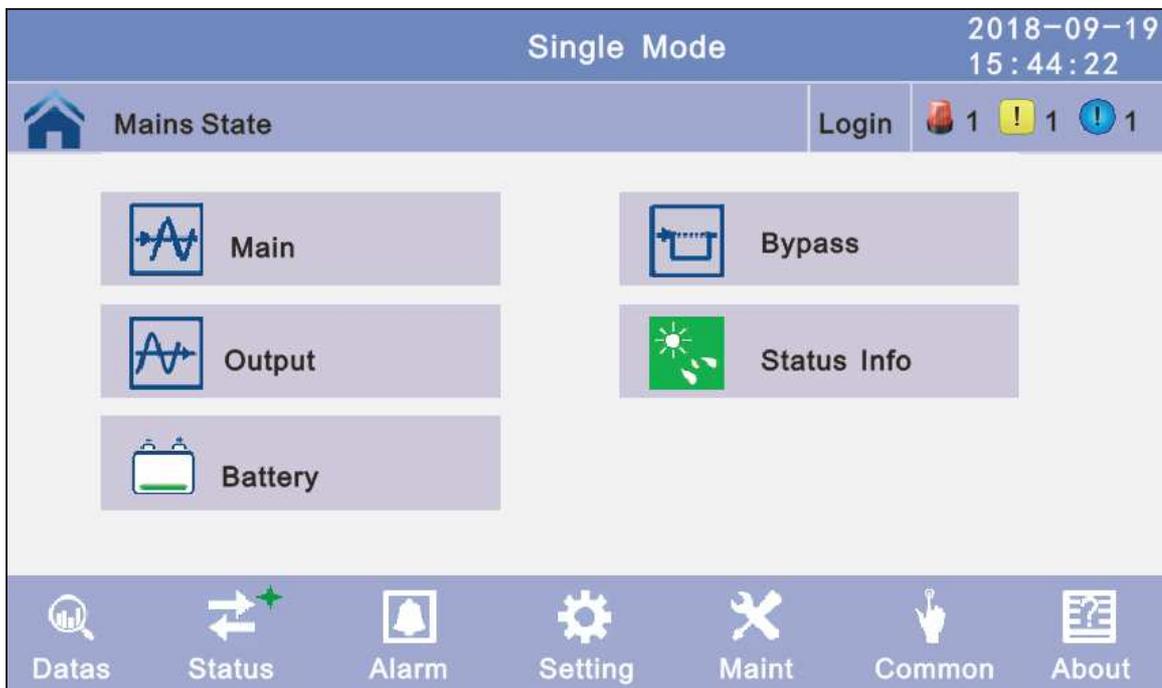

**4.3.1 Datas:** Displays the flow state of UPS work, and quickly enters real-time data by clicking on the block.

**4.3.2 Status:** View the voltage and current of the main, bypass, output, battery (can also be entered through by real-time data block), view the status of the switches, dry contacts, through clicking on the block, enter the corresponding data window.

**4.3.2.1 Main:** Click the main block to enter the main data display window, click return to return to the previous window, click home page to return to the main page.

**4.3.4.1.4 Date and time setting:** Click the text to select other value or input new value and click save config block to save. Click return to return to the previous window, click home page to return to the main page.

**Date:** current date

**Time:** current time

**4.3.4.1.5 Communication setting:** Click the text to select other value or input new value and click save config block to save. Click return to return to the previous window, click home page to return to the main page.

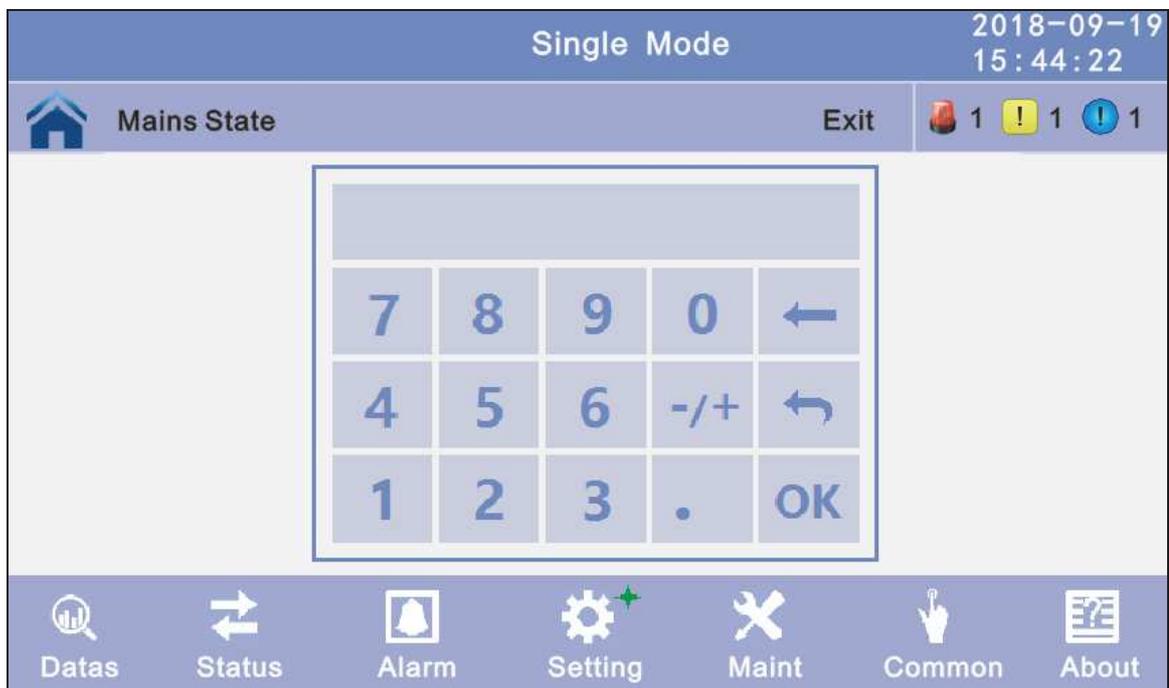

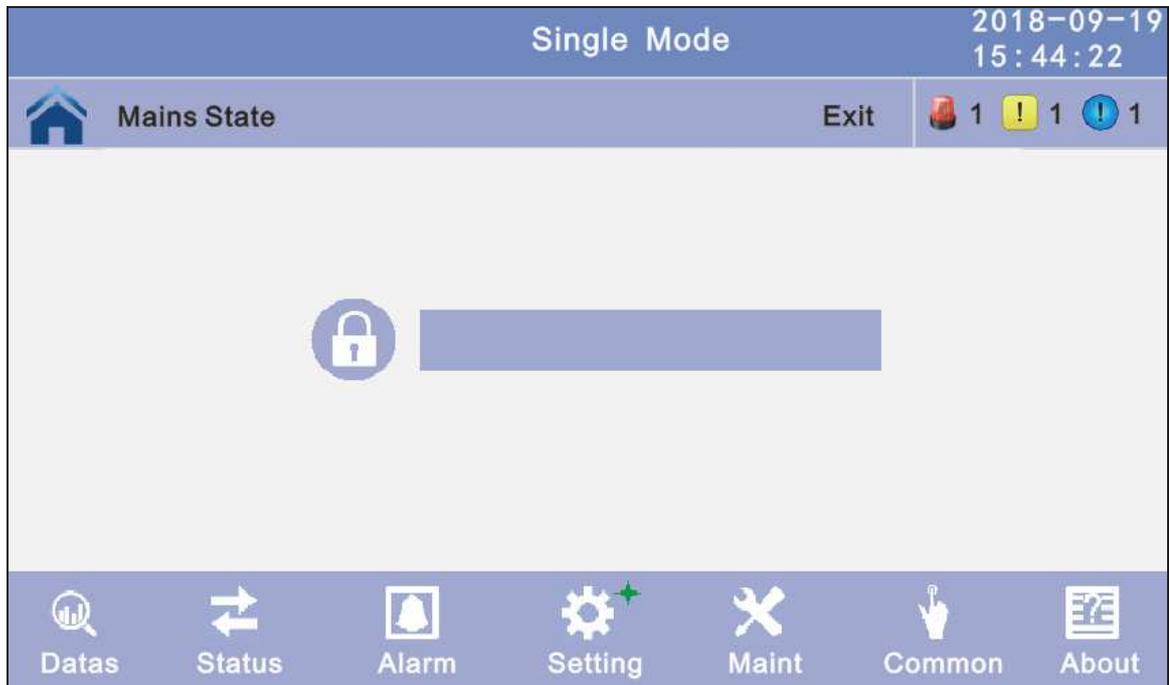

**Rs485 address:** UPS communication ID, address range is 1~15, default is 1

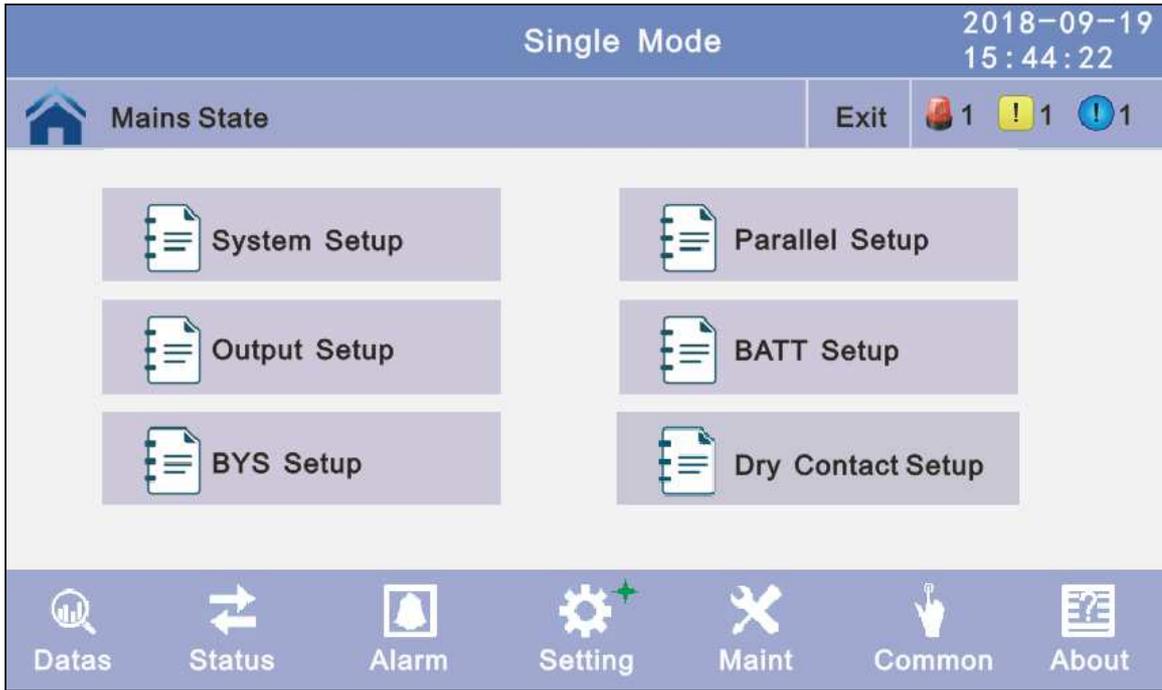

**Rs485 Baud Rate:** baud rate: 2400, 4800, 9600, 14400, 19200, default is 9600

**4.3.4.2 Advanced Setting:** Click advanced setting, enter by input the correct password.

**NOTE:** These operations must be done by professionals or following the instructions of the experts. Request the password from your UPS supplier.

**4.3.4.2.1 System setup:** Click the text to select other value or input new value and click save config block to save. Click return to return to the previous window, click home page to return to the main page.

**Working Mode:** Select the work mode of UPS, work mode: Single mode, Parallel mode, ECO mode.

**Auto Turn-on:** Select the UPS start logic, Enable: UPS start inverter output automatic, Disable: No output.

**Aging Load Rate:** The value can be 18~100%, default value: 60%

**Rreq Conv Mode:** Frequency conversion mode, enable: output frequency set 50Hz or 60Hz, input frequency is 60Hz or 50Hz, UPS no alarm not battery and bypass abnormal. Default is Disable.

**LBS mode:** setting value: LBS disable, LBS master, LBS slave. Default is LBS disable.

**Float Temp. Compen.:** temperature sensor compensation switch, when need to connect battery temperature sensor, please change the value to enable.

**Temp Sensor Select:** temperature sensor type select. Has tow types: NTC and RS485. NTC for single and short distance. Rs485 for multiple and far distance.

**Inter Power Walk in:** this is enable the UPS to control the interval that each rack transfers from battery mode to normal mode, which reduces the impact on the generator or power grid. The value can be 0~200, default value is 10.

**Inter sleep mode:** when load less than the software setting value, same parallel rack will turn to standby mode and if the load more than the setting value some rack will turn to inverter mode after setting the sleep mode enable. Default value is disable.

**Parallel ID:** Parallel operation ID, must modify the ID after set work mode to parallel mode. The value can be 1~6, default value is 1.

**Cabinet Paral Basic Units:** Parallel cabinet number, must modify the total parallel cabinet number after set work mode to parallel mode. The value can be 2~6, default value is 2.

**Cabinet Paral Redunt Units:** Parallel redundancy cabinet number, can modify the redundancy cabinet number after set work mode to parallel mode. The value can be 0~5, default value is 0.

**Chg.cur.limiting coef.:** The charging current limit is a multiple of the battery capacity. The value can be 0.05~0.5, and is 0.1 by default.

**Cell float voltage:** The float voltage value can be 2.23~2.30 V/cell, and is 2.25 V/cell by default.

**Cell boost voltage:** The battery equalized voltage value can be 2.30~2.40 V/cell, and is 2.30 V/cell by default.

**Aver charging Duration:** boost charge time limit, the value can be 1~999min, and is 240 by default.

| <input type="button" value="Save Config"/>  |   |   |   |    |

**EOD Battery Volt:** End of discharge voltage. The value can be 1.60~1.90 and is 1.80 by default.

**Float Temp Compens Coeff:** modify the voltage of compensation after enable the switch. the value can be 0.001~0.007/cell and is 0.003 by default.

**Boost Charge Setting:** Boost charge disable or enable and is enable by default.

**No Battery Warning:** can be no warning when no batter after set disable and is enable by default.

| Single Mode   |   | 2018-09-19<br>15:44:22  |   |   |

| <input type="button" value="Save Config"/>  |   |   |   |    |

**Bypass Volt Prot Lower Limit:** When the difference between the bypass voltage and the rated voltage exceeds the lower threshold for the bypass voltage, the system determines that the bypass voltage is abnormal and that the bypass is unavailable. The value can be -10%, -15%, -20%, -30%, -45%. The default value is -45%.

**Bypass Volt Prot Limit:** When the difference between the bypass voltage and the rated voltage exceeds the upper threshold for the bypass voltage, the system determines that the bypass voltage is not normal and that the bypass is unavailable.

NOTE:

When the voltage level is 380 V, the value range is 10%, 15%, 20%, and 25% (default).

- When the voltage level is 400 V, the value range is 10%, 15%, and 20% (default).
- When the voltage level is 415 V, the value range is 10% and 15%(default).

**Bypass Freq Tracking Range:** When the difference between the bypass input frequency and the rated frequency is greater than this value, the system determines that the bypass frequency is not normal, and that the bypass is unavailable. The value range is 1%, 2%, 4%, 5%, 10%(default).

**Bypass rate tracking rate:** Inverter frequency tracking to bypass frequency rate. The value range is 0.5~2, and is 1 by default.

| Single Mode   |      | 2018-09-19<br>15:44:22  |   |

**Power Supply upon bypass Over Temp:** Specifies whether to start bypass mode when over temperature occurs. The default value is Enable.

**Bypass Switches Limit:** Cross currents occur during the transfer between bypass mode and normal mode, which impacts the system. This parameter specifies the number of transfers between bypass mode and normal mode within 1 hour, which ensures system security. The value can be 3 to 10 and is 10 by default.

**EPO transfers to BYP:** Specifies whether to start bypass mode when EPO occurs. The default value is Enable.

**Battery Abnormal BCB trip(DRV):** Enable or disable BCB trip single output. The default value is Disable.

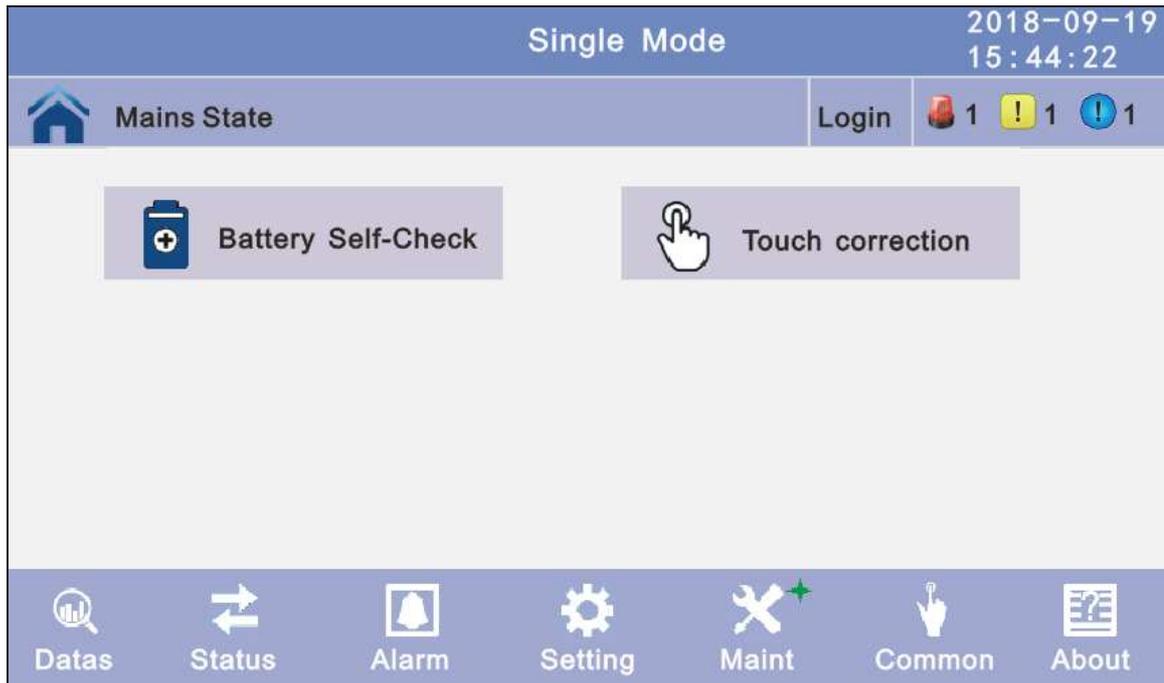

**Bypass Feedback:** Enable or disable bypass feedback output. The default value is Disable.

**External Maint. breaker:** Enable or disable external maintenance breaker connection detection. The default value is Disable.

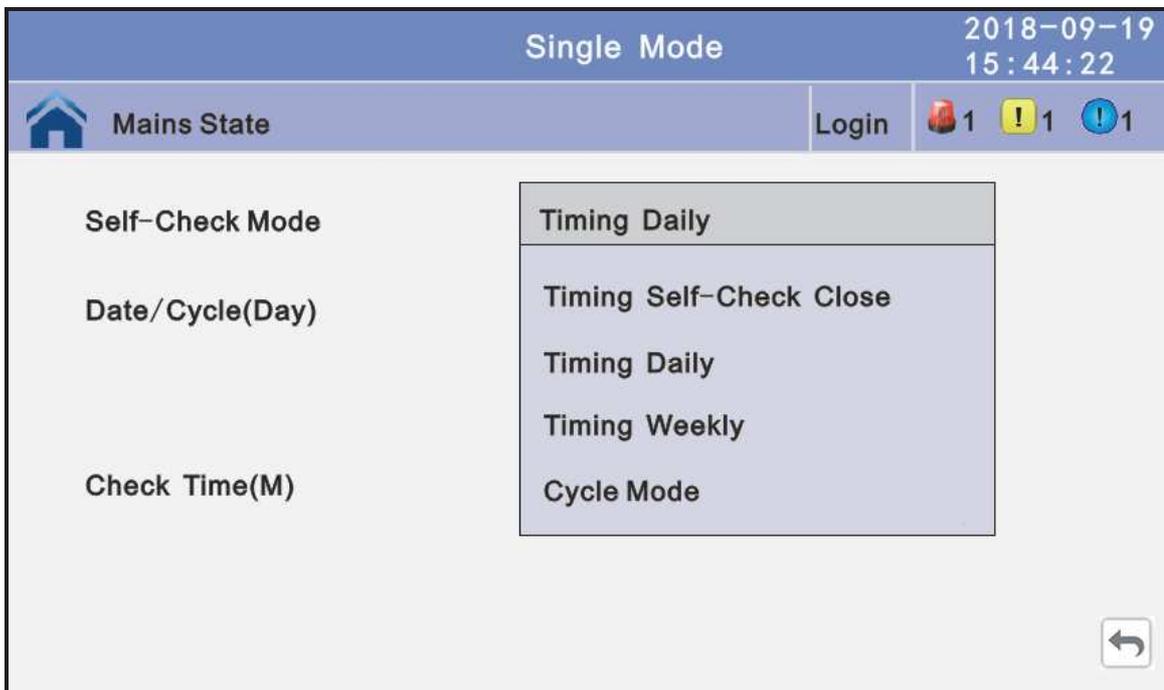

**Battery Switch(BAT):** Enable or disable battery breaker connection detection. The default value is Disable.

**4.3.5 Maint:** Software update, Touch correction, history download and battery self-test.

**4.3.5.1 Battery Self-Check:** can select check by Timing Daily, Timing Weekly, Cycle mode. The default value is Timing Self-Check Close.

**4.3.5.2.1 Timing Daily:** modify the check date, time and check time (10S (default), 10min, EOD).

Single Mode 2018-09-19 15:44:22

**4.3.5.2.3 Timing Cycle mode:** modify the cycle date and check time (10S (default), 10min, EOD).

**4.3.6 Common:** INV ON/OFF, Battery test and Fault clear.

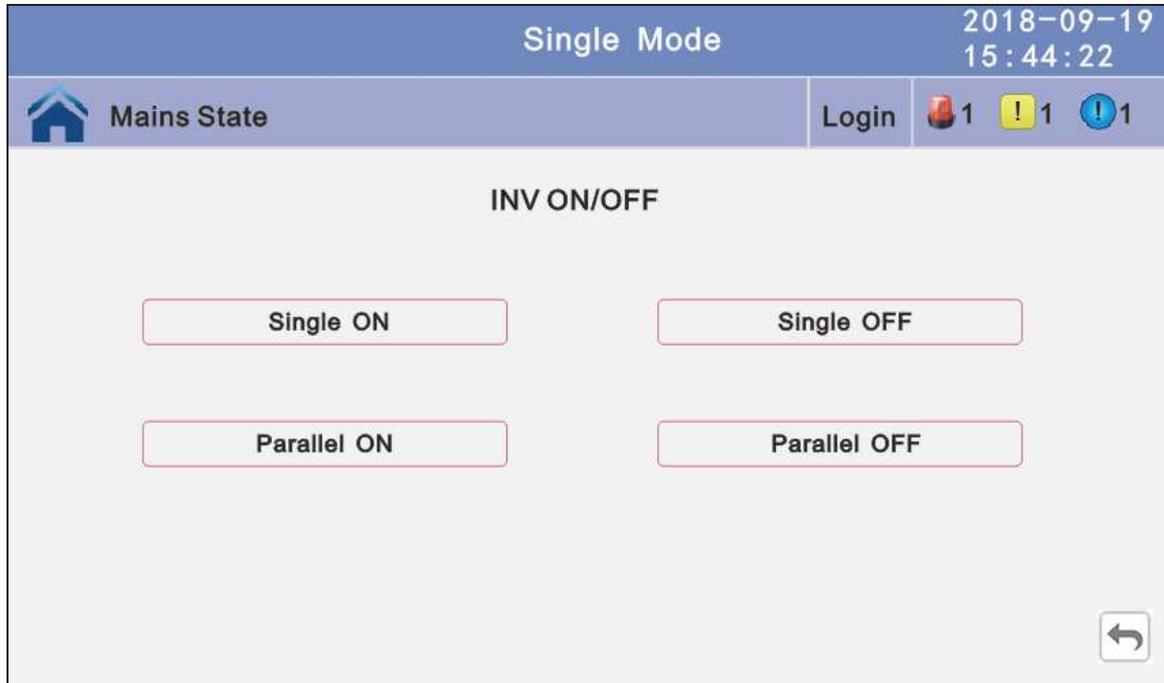

#### 4.3.6.1 INV ON/OFF

**Single OFF:** Inverter OFF location UPS

**Single ON:** Inverter ON location UPS

**Parallel OFF:** Inverter OFF all parallel UPSs

**Parallel ON:** Inverter ON all parallel UPSs

#### 4.3.6.2 Battery Test

**10S:** battery test for 10s

**10min:** battery test for 10min

**EOD:** battery test to EOD

**-10%:** battery test down 10% capability.

**4.3.6.3 Fault clear:** Clear the current fault (not for all faults).

**4.3.7 About:** check the software version

**4.3.7.1 Monitor and LCD software version**

## 4.4 Display Messages/Troubleshooting

This section lists the event and alarm messages that the UPS might display. The messages are listed in alphabetical order. This section is listed with each alarm message to help you troubleshoot problems.

### Display messages

#### Operational Status and Mode(s)

## 4.5 Options

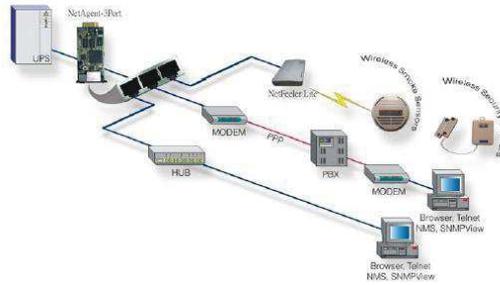

**SNMP card:** internal SNMP / external SNMP optional

- ◆ Loosen the 2 torque screws (on each side of the card).
- ◆ Carefully pull out the card. Reverse the procedure for re-installation

The slot called SNMP supports the MEGAtec protocol. We advise that NetAgent II-3 port is also a tool to remotely monitor and manage any UPS system

NetAgent II-3Ports supports the Modem Dial-in (PPP) function to enable the remote control via the internet when the network is unavailable.

In addition to the features of a standard NetAgent Mini, NetAgent II has the option to add NetFeeler Lite to detect temperature, humidity, smoke and security sensors. Thus, making NetAgent II a versatile management tool. NetAgent II also supports multiple languages and is setup for web-based auto language detection.

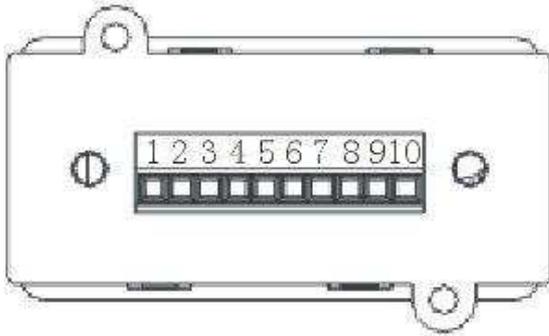

Typical topology of the UPS Network Management

**Relay card:**

A 10-pin terminal is supported to offer the signals of Bypass, Utility Failure, Inverter On, Battery Low, UPS fault, UPS Alarm, and UPS Shutdown for HIPOWER series.

The relay communication card contains six dry contact outputs and one dry input. The inputs and outputs are factory programmed according to functions listed in the table.

Table: Relay Contacts

| Port |              | Function        |
|------|--------------|-----------------|
| 1    | Output       | Utility Failure |
| 2    |              | Battery Low     |
| 3    |              |                 |
| 4    |              | On Bypass       |
| 5    |              | UPS Fault       |
| 6    |              | Inverter On     |
| 7    |              | UPS Fault       |
| 8    |              | COM             |
| 9    | Remote Input | +5~12V          |
| 10   |              | GND             |

## Appendix 2 Problems and Solution

In case the UPS cannot work normally, it might be wrong in installation, wiring or operation. Please check these aspects first. If all these aspects are checked without any problem, please consult with local agent right away and provide below information.

(1) Product model name and serial number.

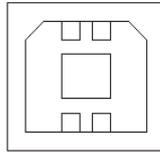

(2) Try to describe the fault with more details, such as LCD display info, LED lights status, etc.

Read the user manual carefully, it can help a lot for using this UPS in the right way. Some FAQ (frequently asked questions) may help you to troubleshoot your problem easily.

| No. | Problem  | Possible reason   | Solution   |
|-----|--|---|--|
| 1   | Utility is connected but the UPS cannot be powered ON.                                 | Input power supply is not connected;<br>Input voltage low;<br>The input switch of the UPS is not switched on.   | Measure if the UPS input voltage/frequency is within the window.<br>Check if UPS input is switched on  |
| 2   | Utility normal but Utility LED does not light on, and the UPS operates at battery mode | The input breakers of the UPS are not switched on;<br>input cable is not well connected   | Switch on the input breaker;<br>Make sure the input cable is well connected.   |
| 3   | The UPS does not indicate any failure, but output do not have voltage                  | Output cable does not well connected;<br>Output breaker do not switch on  | Make sure the output cable is well connected;<br>Switch on the output breaker.   |
| 4   | Utility LED is flashing  | Utility voltage exceeds UPS input range.  | If the UPS operates at battery mode, please pay attention to the remaining backup time needed for your system.   |
| 5   | Battery LED is flashing but no charge voltage and current                              | Battery breaker does not switch on, or batteries are damaged, or battery is reversely connected.<br>Battery number and capacity are not set correctly.                  | Switch on the battery breaker. If batteries are damaged, need to replace whole group batteries, Connect the battery cables correctly;<br>Go to LCD setting of the battery number and capacity, set the correct data. |
| 6   | Buzzer beeps every 0.5 seconds and LCD display "output overload"                       | Overload  | Remove some load   |
| 7   | The UPS only works on bypass mode  | The UPS is set to ECO mode, or the transfer times to bypass mode are limited.   | Set the UPS working mode to UPS type(non-parallel) or to reset the times of transferring to bypass or re-start the UPS   |
| 8   | Cannot Black start   | Battery switch is not properly closed:<br>Battery fuse is not open:<br>Or Battery low:<br>Battery quantity set wrong;<br>Power breaker in the rear panel not switch ON. | Close the battery switch:<br>Change the fuse:<br>Recharge the battery:<br>Power ON the UPS with AC to set the battery quantity & quantity;<br>Switch on the power breaker.   |

## Appendix 3 USB communication port definition

Definition of port:

Connection between PC USB port and UPS USB port.

| PC USB port | UPS USB port | Description        |
|-------------|--------------|--------------------|
| Pin 1       | Pin 1        | PC : +5V           |
| Pin 2       | Pin 2        | PC : DPLUS signal  |
| Pin 3       | Pin 3        | PC : DMINUS signal |
| Pin 4       | Pin 4        | Signal ground      |

Available function of USB

- ◆ Monitor UPS power status.
- ◆ Monitor UPS alarm info.
- ◆ Monitor UPS running parameters.
- ◆ Timing off/on setting.

Communication data format

Baud rate ----- 9600bps

Byte length ----- 8bit

End bit ----- 1bit

Parity check -----none

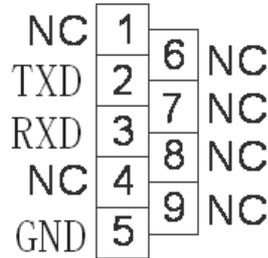

### CAUTION!

**USB and RS232 interface cannot be used at the same time, you can only use one of them at one time.**

## Appendix 4 RS232 communication port definition

Definition of Male port:

Connection between PC RS232 port and UPS RS232 port

| PC RS232 port | UPS RS232 port |                     |
|---------------|----------------|---------------------|
| Pin 2         | Pin 2          | UPS send,PC receive |
| Pin 3         | Pin 3          | PC send,UPS receive |
| Pin 5         | Pin 5          | ground              |

Available function of RS232

- ◆ Monitor UPS power status.
- ◆ Monitor UPS alarm info.
- ◆ Monitor UPS running parameters.
- ◆ Timing off/on setting.

RS-232 communication data format

Baud rate ----- 9600bps

Byte length ----- 8bit

End bit ----- 1bit

Parity check -----none

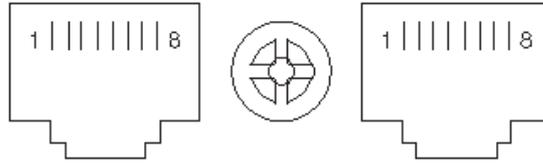

### CAUTION!

**USB and RS232 interface cannot be used at the same time, you can only use one of them at one time.**

## Appendix 5 RS485 communication port definition

Definition of port:

Connection between the Device's RS485 port and UPS RS485 port.

| device(RJ45) | UPS(RJ45) | Description |
|--------------|-----------|-------------|
| Pin 1/5      | Pin 1/5   | 485+ "A"    |
| Pin 2/4      | Pin 2/4   | 485 - "B"   |
| Pin7         | Pin7      | +12Vdc      |
| Pin8         | Pin8      | GND         |

Available function of RS485

- ◆ Monitor UPS power status.
- ◆ Monitor UPS alarm info.
- ◆ Monitor UPS running parameters.
- ◆ Timing off/on setting.
- ◆ Battery environment temperature monitoring.
- ◆ Charging voltage modulation depending on batteries temperature

Communication data format

Baud rate ----- 9600bps

Byte length ----- 8bit

End bit ----- 1bit

Parity check -----none

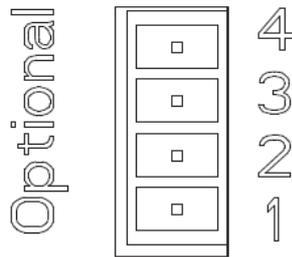

**CAUTION!**

**RS485 port pin7 is 12Vdc!**

## Appendix 6 Optional port definition

Definition of Male port:

Instruction:

Relay Dry Contact Port 5A/277Vac

| UPS  | Instruction |
|------|-------------|
| Pin1 | Normally NC |
| Pin2 | Normally NO |
| Pin3 | /           |
| Pin4 | Common      |

Function 1 description (default, internal J6 jumper):

- ◆ Drive the bypass breaker when backfeed alarm.

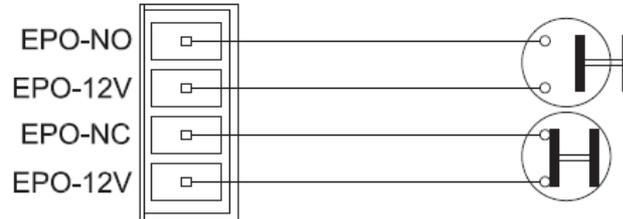

Function 2 description (Optional, internal J5 jumper):

- ◆ Drive the battery breaker when battery voltage low.

## Appendix 7 REPO instruction

Definition of port:

Connection diagram:

Connection between the button and UPS REPO port.

| Button | UPS REPO | Description |
|--------|----------|-------------|
| Pin 1  | Pin 1    | EPO-NO      |
| Pin 2  | Pin 2    | EPO-12V     |
| Pin 1  | Pin 3    | EPO-NC      |
| Pin 2  | Pin 4    | EPO-12V     |

- ◆ A remote emergency stop switch can be installed in a remote location and connection through simple wires to the REPO connector.

## Appendix 8 Backfeed Protection

### Backfeed Protection

The presence of a backfeed protection is required by IEC 62040-1 UPS standard.

An additional external isolation device must be installed upstream the UPS system. A magnetic contactor or a circuit breaker with UVR (Under Voltage Release) functionality can be used for this purpose.

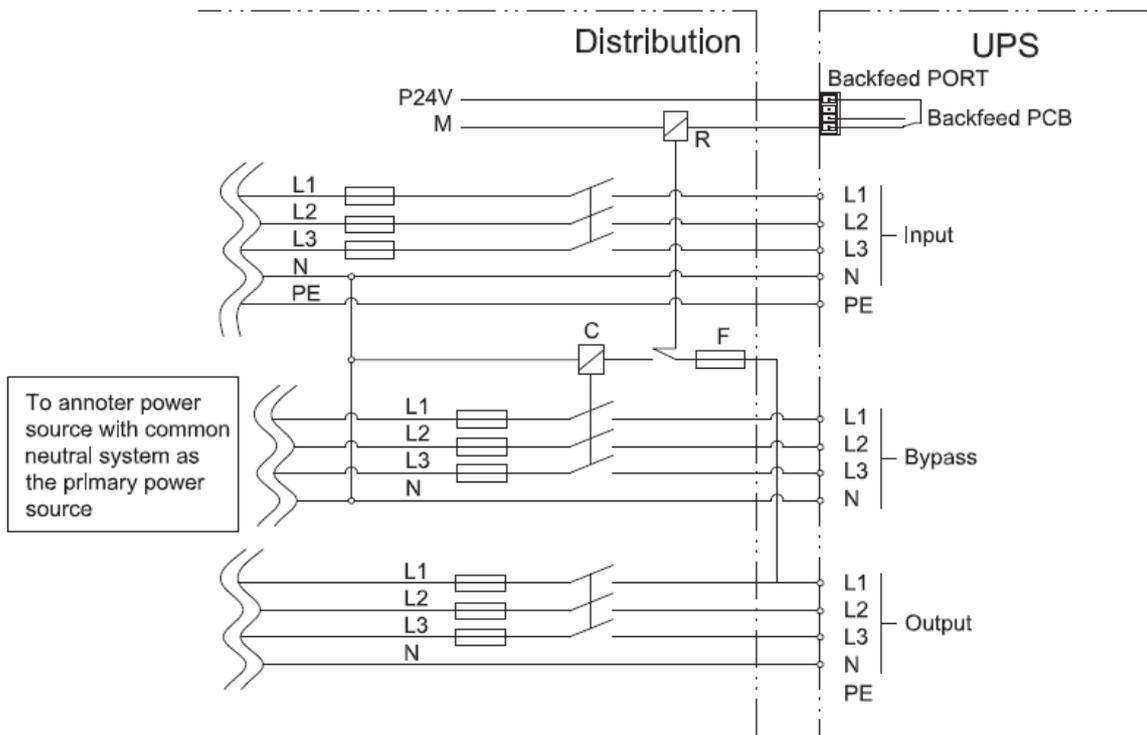

The isolation device must be able to carry the UPS input current (common input in case of single source, bypass input in case of dual source).

E.g. an isolation device can be a magnetic contactor. The coil of the contactor should be supplied by (eg. fused L1-N voltage) the input source in single mains configurations or by the bypass source in dual mains configurations, via the output port as per Appendix 6.

If the contactor coil exceeds the voltage/current limits of the UPS output port a 24 Vcc source should be generated from the same source the contactor coil is supplied from, in order to supply an additional external auxiliary relay coil. The relay contact, properly rated, should allow to supply the contactor coil.

### Backfeed installation with relay:

1. Connect the UPS backfeed dry contact port to an external +24 VDC supply pole “+”. Route the cable with the other signal cables.
2. Connect the UPS backfeed dry contact to a terminal of the relay R coil. Route the cable with the other signal cables.
3. Connect the terminal of the relay R coil to a +24 VDC supply pole “-” (M).
4. Connect the fuse F, the auxiliary contact of relay R, and the coil of C as shown in the illustration below.
5. Connect C (L1, L2, L3) with UPS output (L1, L2, L3) as shown in the illustration below.
6. Connect bypass input (N) with mains feeding (N) in the distribution.

### Backfeed installation without relay:

1. Connect the UPS backfeed dry contact port 1 to F. Route the cable with the other signal cables.
2. Connect the UPS backfeed dry contact port 4 to the contactor C coil. Route the cable with the other signal cables.
3. Connect the fuse F and the coil of C as shown in the illustration below.
4. Connect C (L1, L2, L3) with UPS output (L1, L2, L3) as shown in the illustration below.
5. Connect bypass input (N) with mains feeding (N) in the distribution.
